# SELECTED WATER RESOURCES ABSTRACTS

VOLUME 8, NUMBER 19
OCTOBER 1, 1975

W75-09351 — W75-09850
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

# SELECTED
# WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

**VOLUME 8, NUMBER 19**
OCTOBER 1, 1975

W75-09351 -- W75-09850

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

# FOREWORD

**Selected Water Resources Abstracts,** a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

**Selected Water Resources Abstracts** is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

## CONTENTS

FOREWORD ..... iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

**01** NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

**02** WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

**03** WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

**04** WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

**05** WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

**RECHARGE SIMULATION MODEL,**
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
D. M. Manbeck.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 502, $3.25 in paper copy, $2.25 in microfiche. Completion Report, June 1975. 21 p, 2 fig, 4 tab, 2 ref. OWRT A-028-NEB(1). 14-31-0001-5027.

Descriptors: *Artificial recharge, Model studies, Aquifers, Groundwater, *Mathematical models, *Simulation analysis, Computer programs, *Soil moisture, *Groundwater movement.

A mathematical model simulating the movement of water from the soil surface to groundwater was developed and programmed for the IBM 360/65 computer in Fortran IV language. Components of the model include precipitation, irrigation amounts, air temperature, saturation soil moisture content and hydraulic conductivity, volumetric moisture vs. moisture potential relationship, and thickness and number of strata. The model generates the amount of water from precipitation and irrigation sources moving vertically downward from one soil layer to the next on a monthly basis with given initial conditions. The input values and mathematical relationships are used to simulate the following processes: (1) interception by vegetation; (2) surface runoff; (3) evapotranspiration; and (4) percolation. The percolation or moisture movement from the last layer just above the water table is considered recharge to the groundwater system. Flow of moisture in the soil is assumed to be one dimensional and occurs under saturated and unsaturated conditions. The concept of one-dimensional flow restricts the accuracy of the model because soil moisture movement is very complicated and more complex relationships are not amenable to easy solution.

**SURFACE WATER RESOURCES OF ST. JOHNS RIVER, FLORIDA,**
Reynolds, Smith and Hills, Jacksonville, Fla.
Z. Qureshi.
Water Resources Bulletin, Vol 11, No 3, p 568-574, June 1975. 2 fig, 4 ref.

Descriptors: *Surface water availability, *River basins, *Florida, *Water resources, Environment, Drainage area, Consumptive use, Hydraulic gradient, Average flow, Swamps, Hydrology, Channel flow, Springs, Low flow, Backwater, Storage capacity, Flow characteristics, Tidal effects, Navigation.
Identifiers: *St. Johns River(Fla), Reverse flow, Oklawaha River basin(Fla).

The St. Johns River basin is the largest watershed entirely within Florida, and it is one of the few northward flowing rivers in the United States. The river basin contains 29,606 sq km of which 24,424 sq km are drained by the river and its tributaries. The remainder drains into the Atlantic Ocean of the Intracoastal Waterway. Its largest sub-basin is the Oklawaha River Basin, which has a drainage area of 7433 sq km. Ground elevations range from sea level to 61 m above mean sea level in the main river basin and as high as 91 m above mean sea level in the Oklawaha River basin. The surface water resources of the St. Johns River and the existing consumptive uses were investigated. The analysis revealed that the river is an extremely large and valuable resource which has been underutilized and could play a much stronger role in serving the needs of the people in the basin. (Roberts-ISWS)

**REGIONAL ANALYSES OF RUNOFF CHARACTERISTICS FOR SMALL URBAN WATERSHEDS,**
Utah Water Research Lab., Logan.
J. P. Riley, E. K. Israelsen, and G. B. Shih.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 517, $4.25 in paper copy, $2.25 in microfiche. Completion Report PRWG87-1, April 1975. 69 p, 21 fig, 5 tab, 64 ref, 4 append. OWRT B-047-UTAH(1). 14-31-0001-3340.

Descriptors: Water resources, Urban hydrology, Hydrology, Hydrologic cycle, *Storm runoff, Computer models, Mathematical models, *Texas, Small watersheds, Peak discharge, *Regional analysis, Rainfall-runoff relationships, Simulation analysis, *Regression analysis, Model studies, *Runoff forecasting.
Identifiers: Austin(Tex), Houston(Tex), Dallas(Tex), Fort Worth(Tex), *Urban watersheds.

A general method was developed for estimating runoff rates and associated confidence limits of a given recurrence interval for ungaged small urban watersheds. The utility of the method developed was demonstrated through its application to a southeast region of Texas. Some 200 historical rainfall-runoff events from 40 watersheds in Houston, Austin, Dallas, and Fort Worth urban areas were analyzed. Watershed data such as drainage area, percent of urbanized area, channel length, average channel slope, land slope, and soil type are documented. Total rainfall amounts intensities, durations, and mass-time distributions were determined for each storm and used to develop a rainfall generating model. Peak runoff, total runoff volume, and runoff duration are also determined. Statistical analyses were performed to develop regression models to relate peak runoff and total runoff volume with rainfall and watershed characteristics as independent variables. An urban watershed runoff model, based on the Utah Simulation Model, was used to identify the model parameters for each watershed by reproducing the historical storms. Relationships between model parameters and measured watershed variables were established. By combining the rainfall generating model and the watershed runoff model, peak runoff rates and total runoff volumes for different conditions were generated for chart construction.

**MATHEMATICAL MODELS IN HYDROLOGY,**
Institute of Hydrology, Wallingford (England).
R. T. Clarke.
Food and Agriculture Organization of the United Nations, Rome, Irrigation and Drainage Paper No 19, 1973. 282 p, 6 fig, append, 79 ref.

Descriptors: Hydrology, *Computer models, *Mathematical models, Water resources development, *Model studies, *Hydrologic models, Simulation analysis, Water management(Applied), Arid lands, *Reviews, *Bibliographies.

This manual attempts to advance the use of mathematical models in hydrology from a theoretical level to practical application. The state-of-the-art is reviewed; models are useful in extracting the maximum amount of information from available data. Since data are often slight in developing countries, particularly in sparsely inhabited arid regions, such models, if used with caution, could have great application in such nations. Various models are examined, and the appendix contains computer programs. A decision-making method is described that is cheap, flexible, and competent in working with meager data bases. **BIBLIOGRAPHY OF U.S. GEOLOGICAL SURVEY WATER-RESOURCES REPORTS FOR UTAH,**
Geological Survey, Salt Lake City, Utah.
B. A. LaPray.
Utah Department of Natural Resources, Salt Lake City, Information Bulletin No 23, 1975. 58 p, 4 tab.

Descriptors: *Bibliographies, *Water resources, *Publications, *Utah, Hydrologic data, Surface waters, Groundwater, Water quality, Streamflow, Runoff, Hydrology, Hydrogeology, Aquifer characteristics, Groundwater movement, Wells, Floods, Chemical analysis, Information retrieval.

This bibliography contains a complete listing to December 31, 1974, of reports relating to the water resources of Utah prepared by personnel of the U.S. Geological Survey. Discussions of the related subjects of geology, hydrology, and chemical quality of the water are included in many of the reports. The reports were, for the most part, prepared by personnel assigned to the Water Resources Division, Utah District, in cooperation with State and local agencies. The bibliography is divided into four major parts: (1) publications of the Geological Survey; (2) publications by agencies of the State of Utah; (3) other publications--reports prepared by Survey personnel, but published by other agencies or by professional organizations in their journals; and (4) open-file reports of the Geological Survey. (Woodard-USGS)

A NON-LINEAR RAINFALL-RUNOFF MODEL, PROVIDING FOR VARIABLE LAG TIME,
Newcastle-upon-Tyne Univ. (England). Dept. of Engineering Mathematics.
D. W. Reed, P. Johnson, and J. M. Firth.
Journal of Hydrology, Vol 25, No 3/4, p 295-305, May 1975. 4 fig, 1 tab, 9 ref.

Descriptors: *Runoff, *Unit hydrographs, *Rainfall-runoff relationships, *Hydrograph analysis, Hydrology, Rainfall, Hydrographs, Analysis, Storage, Distribution, Discharge(Water), Precipitation excess, Model studies, Watersheds(Basins).
Identifiers: *Lag time.

The cascading reservoir analogue of the rainfall-runoff process was extended, by the introduction of a third parameter, to apply to catchments exhibiting variable lag times. A semi-empirical relationship between lag time and storage was incorporated and the total-runoff hydrograph was computed. The resulting nonlinears, three-parameter model produced better representation of an observed rainfall-runoff event than the linear, gamma-distribution model. (Adams-ISWS)
W75-09753

## 2B. Precipitation

METHODOLOGICAL APPROACHES IN HAWAIIAN FOG RESEARCH,
Hawaii Univ., Honolulu. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 508, $3.75 in paper copy, $2.25 in microfiche. Technical Report No 85, March 1975. 34 p, 16 fig, 2 tab, 16 ref. OWRT A-041-HI(1). 14-31-0001-4011.

Descriptors: *Fog, *Precipitation(Atmospheric), *Raindrops, Water balance, Rainfall, Wind, *Hawaii, Networks, Methodology, Computer programs, Instrumentation, Measurement, Sampling.
Identifiers: *Fog analysis computer program, *Hawaiian upslope fog, *Droplet size, *Fog sampling network, Louvered screen, Fog gage, Fog interceptor, Grunow gage.

Recent studies have demonstrated the important moisture contribution from fog precipitation in mountain areas on the island of Hawaii. Research methodologies useful in the study of Hawaiian upslope fog were investigated, included: (1) development of an improved fog gage; (2) development of indirect approximation methods for estimating average droplet sizes during precipitation episodes and separating fog and rainfall components; (3) establishment of an extensive fog sampling network on the island of Hawaii employing continuous recording equipment, for both rain, fog, and wind; (4) development of an original computer program for detailed temporal and spatial analysis of rain, fog, and wind parameters.

THE EVOLUTION OF DROP SPECTRA DUE TO CONDENSATION, COALESCENCE AND BREAKUP,
Arizona Univ., Tucson. Inst. of Atmospheric Physics.
K. C. Young.
Journal of the Atmospheric Sciences, Vol 32, No 5, p 965-973, May 1975. 10 fig, 24 ref.

Descriptors: *Coalescence, *Condensation, *Nucleation, *Drops(Fluids), Numerical analysis, Clouds, Model studies, Rain, Stochastic processes, Supersaturation.
Identifiers: Warm rain processes, Drop breakup, Collection efficiency, Drop collision.

A numerical model of warm rain processes incorporating activation of cloud condensation nuclei, drop growth by condensation and stochastic coalescence, and drop breakup was described. A collisional breakup model was compared to a spontaneous disintegration model and found not only to dominate over the spontaneous disintegration model but to produce an exponential spectrum in fair agreement with average observed drop spectra. The steady-state spectrum was found to be quite insensitive to the number of satellite drops formed by collision or their size distribution. The effect of the finite-difference solution to the collection and breakup equations was analyzed. A properly stochastic formulation for finite time steps was presented but found to differ only slightly from the simpler, 'discrete' formulation. Time steps of 5 s and 45 size categories were found adequate to describe the essential quantitative features of more intensive treatments. The model results were found to be somewhat sensitive to values used for the collection efficiency. (Jones-ISWS)
W75-09597

GEOGRAPHIC VARIATION OF THE STATISTICAL PARAMETERS OF HYDROMETEOROLOGICAL DATA OF THE UNITED STATES,
Central and Southern Florida Flood Control District, West Palm Beach.
A. N. Shahane, D. Thomas, and P. Bock.
Water Resources Bulletin, Vol 11, No 3, p 584-598, June 1975. 9 fig, 3 tab, 5 ref.

Descriptors: *Variability, *Climatology, *Hydrology, *Meteorology, *Statistics, *United States, Parametric hydrology, Analysis, Drainage area, Geographical regions, Time-series analysis, Correlation analysis, Topography, Statistical methods, Data processing.
Identifiers: *Variance analysis, Autocorrelation coefficients, Serial correlation coefficients.

A methodology was developed to assess variations of statistical parameters of the hydrologic cycle of the United States by generating seven hydrometeorological time series for 76 small and 10 large drainage basins. Two conceptually different approaches (one using directional strips of large combined watersheds and the other using analysis of variances) were employed to explore the geographic variation of the statistical parameters (autocorrelations and explained variances) in question. Results adequately indicate the correspondence between these variations and the observed topographic, climatologic, and hydrologic characteristics over the United States. The results indicated a noticeable change in autocorrelation coefficients for precipitation and evapotranspiration series on either side of the Appalachian Rocky Mountains. Analysis of variance indica a significant linear north-south effect only evapotranspiration series. Analysis of variance explained variances of hydrometeorological c ponents indicated a signficant quadratic variat in the north-south direction for runoff, precip tion, and change in storage series. In east-w directions, runoff and precipitation series show significant variation in their explained varia values. (Roberts-ISWS)

A WIND TUNNEL INVESTIGATION ON I MULTIPLICATION BY FREEZING OF WATE DROPS FALLING AT TERMINAL VELOCI IN AIR,
California Univ., Los Angeles. Dept. Meteorology.
For primary bibliographic entry see Field 2C.
W75-09613

THE MICROWAVE EMISSION SPECTU FROM SPARKING WATER DROPS,
New Mexico Inst. of Mining and Technolog Socorro. Dept. of Physics.
G. D. Sower.
Journal of Geophysical Research, Vol 80, No 3 355-365, January 20, 1975. 7 fig, 27 ref. ONR Co tract N00014-67-A-0267-0157, NSF Grant G 32591X.

Descriptors: *Drops(Fluids), *Electrical prope ties, *Radiation, Microwaves, Clouds, Rad waves.
Identifiers: *Collisions, *Sparks, Radiomete Liquid water content.

The microwave emission spectrum was obtaine for the discharge during collision of two opposite charged water drops of equal size in the absence an external electric field. The power spectra o tained for drops 1.00 and 1.50 mm in diamet covering the frequency range 3291-10,940 MH show pronounced maximums and minimums, u like blackbody radiation, which follows an sq law, where f is the frequency. These results impl that radiation from sparking drops is separate fro the thermal radiation from clouds. The variation radiated energy E with drop size d and charge Q found at 9210 MHz to be E proportional to Q to th 6.6 power divided by 10 to the 1.96d power. Fo colliding drops of equal size, the radiated intensit is dependent on the total charge neutralize between the drops and not on how the charge is in itially distributed, even when one drop is initiall uncharged. On the basis of the experimenta results a simple cloud model was used to calculat contributions to the antenna temperature of radiometer from (1) the electrical activity due t sparking drops and (2) the cloud liquid wate present in the antenna beam. It appears feasible t utilize a dual-wavelength radiometer as a remot sensing probe to determine simultaneously th liquid water content and the electrical activity i certain types of storms. (Jones-ISWS)
W75-09614

A STOCHASTIC MODEL OF N-DAY PRECIPITATION,
Ecole Polytechnique, Montreal (Quebec).
P. Todorovic, and D. A. Woolhiser.
Journal of Applied Meteorology, Vol 14, No 1, p 17-24, February 1975. 6 fig, 1 tab, 7 ref, append.

Descriptors: *Precipitation(Atmospheric), *Stochastic processes, Markov processes, Analytical techniques, Model studies, Probability, Numerical analysis.
Identifiers: Distribution functions, Binomial-exponential model.

General expressions were derived for the distribution functions of the total amount of precipitation and the largest daily precipitation occurring in an

n-day period. Two special cases were considered: (1) the probability of occurrence of precipitation on any day in an n-day period is a constant (binomial counting process) and (2) the probability of occurrence of precipitation on any day depends on whether the previous day was wet or dry (Markov chain counting process). The distribution function for daily precipitation was assumed to be exponential. Analytic expressions were derived for the distribution functions for total precipitation or precipitation greater than a threshold. For the numerical example chosen, the Markov chain-exponential model was slightly superior to the binomial-exponential model. This stochastic model seemed to have several advantages over present approaches. (Jones-ISWS)
W75-09747

**RECENT AFRICAN RAINFALL PATTERNS,**
Massachusetts Inst. of Tech., Cambridge. Dept. of Meteorology.
M. Tanaka, B. C. Weare, A. R. Navato, and R. E. Newell.
Nature, Vol 255, No 5505, p 201-203, May 15, 1975. 4 fig, 1 tab, 11 ref.

Descriptors: *Rainfall disposition, *Africa, *Distribution patterns, Precipitation(Atmospheric), Rainfall, Isohyets, Analysis, Evaluation, Average, Seasonal, Summer, Hyetographs.
Identifiers: *Sahel.

Presented were the results of a pilot study aimed at creating a more concrete basis for discussion of the variability in both space and time of rainfall in the Sahel. The Sahel region was defined as that extending across the entire African continent between 10 deg N and 20 deg N. The area west of approximately 30 deg E is a fairly regular plain; to the east are the Nile River Basin of Sudan and the mountains of Ethiopia. The atmospheric circulation system that brings rain to this region is the ascending branch of the tropical Hadley cell, often called the Intertropical Convergence Zone (ITCZ), which moves north of the equator in the Northern Hemisphere summer. This system usually reaches its most northerly position in August, the wettest month over the Sahel. The analysis was concentrated on August for years with good climatic records (1941-1973). Average August rainfall patterns were presented for 1941-1950 and 1951-1960, and the years 1964, 1968, and 1972. The Sahel region had about 10% more rainfall during 1951-1960 than in 1941-1950. The rainfall pattern for August 1964 was similar to those for 1951-1960. The lowest precipitation during 1941-1973 was in 1972 and 1973. (Humphreys-ISWS)

**DROUGHT, A RECURRENT ELEMENT OF CLIMATE,**
Maryland Univ., College Park. Graduate Program in Meteorology.
H. E. Landsberg.
Paper presented on June 6, 1974, at 26th Meeting of Executive Committee of World Meteorological Organization, Geneva, Switzerland, 1974. 49 p, 26 fig, 2 tab, 40 ref.

Descriptors: *Drought, *Africa, *Forecasting, *Arid climates, *Climatology, *Meteorological data, Statistics, Statistical models, Environmental effects, Exploitation, Biomes, Deserts, Ecology, Dry seasons, Weather modification.
Identifiers: Sahel, Dust bowl, Desertification.

Drought is a recurrent element of climate and there is no need to invoke climatic change as a cause each time drought occurs. Research in past decades has made it possible to predict the risk of drought in different regions. Numerous examples are given of the applicability of statistical methods in predicting droughts and other weather anomalies. Humans heighten the consequences of drought in arid and semi-arid regions when their exploitation of the land lessens its ability to recover. The Sahel in Africa today and the Great Plains in the United States in the 1930's are examples of such an overuse. Drought is part of the climatic pattern in all parts of the world. Dry regions bear the brunt of these fluctuations since their ecosystems are more fragile than moister regions. Where in the past nomadism and migration were a way out of drought, population pressures and political aspects now aggravate the problem. Anticipation of droughts can mitigate their consequences. Current techniques, including weather modification, can alter them. (Bowden-Arizona)

## 2C. Snow, Ice, and Frost

**OPTIMIZING LONG-TERM STREAMFLOW FORECASTS,**
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
For primary bibliographic entry see Field 4A.
W75-09594

**THE FRAGMENTATION AND ELECTRIFICATION OF FREEZING DROPS,**
Toronto Univ. (Ontario). McLennan Lab.
R. J. Kolomeychuk, D. C. McKay, and J. V. Iribarne.
Journal of the Atmospheric Sciences, Vol 32, No 5, p 974-979, May 1975. 4 fig, 5 tab, 23 ref.

Descriptors: *Drops(Fluids), *Freezing, *Electrical properties, Saturation, Laboratory tests, Nitrogen, Ice, Crystals, Gases.
Identifiers: *Fragmentation, *Electrification, Splintering, Cracking.

Drops in the size range 1.2 to 1.9 mm were frozen while floating in a nitrogen stream. Frequency of splitting and cracking was found to be 80-90% when the gas was dry and 57% when it was saturated with water vapor. During freezing, about half of the drops acquired charges (of both signs) in the order of several tenths of a picoColumb and the sam proportion (in separate experiments) produced splinters, giving an average of about 10 splinters per frozen drop. (Jones-ISWS)
W75-09598

**A WIND TUNNEL INVESTIGATION ON ICE MULTIPLICATION BY FREEZING OF WATERDROPS FALLING AT TERMINAL VELOCITY IN AIR,**
California Univ., Los Angeles. Dept. of Meteorology.
H. R. Pruppacher, and R. J. Schlamp.
Journal of Geophysical Research, Vol 80, No 3, p 380-386, January 20, 1975. 1 fig, 1 tab, 53 ref.

Descriptors: *Drops(Fluids), *Freezing, *Clays, *Nucleation, Ice crystals, Supercooling, Rime, Aerosols, Laboratory tests, Meteorology, Ice.
Identifiers: *Splintering, *Fragmentation.

The freezing behavior of waterdrops nucleated by contact with clay particles was studied. The experimental setup utilized a cloud tunnel which allowed retrieval of the frozen particles from the airstream for study under a microscope. The mode of fragmentation of freezing waterdrops was investigated. It was found that, depending on the drops surface temperature, up to 42% of the drops frozen by contact nucleation with a clay aerosol transformed into ice particles with surface breaks that resulted from ejection of 1 splinter, whereas only up to 8.5% shattered into 2-3 fragments and only up to 6.3% totally ruptured into a large (3) but undetermined number of very small ice fragments. Drops frozen by clay particles submerged in a drop did not shatter and they produced much fewer frozen drops with surface breaks. It was concluded that ice multiplication by freezing and splintering of freely falling drops cannot account for the large concentration of icy crystals found in certain clouds with top temperatures warmer than -10C, although, the mechanism cannot be ignored. It may contribute to the start of the ice multiplication mechanism which, according to Hallett and Mossop, is efficiently carried on by the production of ice splinters during riming. (Jones-ISWS)

**HEAT TRANSFER IN SOIL-WATER-ICE SYSTEMS,**
Dames and Moore, Washington, D.C.
A. Mohan.
Journal of the Geotechnical Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No GT2, Paper 11123, p 97-113, February 1975. 6 fig, 20 ref, 2 append.

Descriptors: *Heat transfer, *Frozen soils, *Ice, *Mathematical models, Theoretical analysis, Finite element analysis, Soil water, Soil mechanics, Temperature, Soils, Freezing, Thawing, Equations, Computer models, Water, Soil engineering, Frost action, Conduction.

The finite element method has an excellent solution capability for problems requiring transient temperature distribution under time-dependent temperature initial and boundary conditions. Some exceptional features in handling are: space variations of temperature-dependent material properties, irregular boundary geometries of problem regions, temperature and heat flux boundary conditions at any point in the problem region, and freedom in varying the size of the finite discretization within the problem region. Presented was a general computer-oriented solution technique for geotechnical problems of heat conduction, including the effect of latent heat generation and absorption. A variational principle was applied for initial boundary value problems of unsteady heat flow, and the finite elements method was used to generate approximate solutions to plane and axisymmetric problems. Variation in physical and thermal properties of materials with both temperature and space, and functional relationships between the amount of water frozen and the temperature were taken into account automatically during the process of heat conduction. Comparison of computer solutions with exact solutions of two examples showed an excellent agreement, even for a coarse element representation of an infinite medium in a finite region. The finite element method is potentially a powerful tool for prediction of temperature distribution and rate of thaw (freeze) of frozen (unfrozen) media due to an imposed source (sink) of heat and under natural environmental conditions. (Humphreys-ISWS)

**THE PREDICTION OF LAKE HURON LAKE-EFFECT SNOWFALL SYSTEMS,**
Nebraska Univ., Lincoln. Dept. of Geography.
K. F. Dewey.
Journal of Applied Meteorology, Vol 14, No 1, p 3-7, February 1975. 4 fig, 1 tab, 9 ref.

Descriptors: *Forecasting, *Lake Huron, *Snowfall, Snow, Energy budget, Evaporation, Ice cover, *Data collections, Lakes, Theoretical analysis, Statistical methods, Great Lakes region, Heat budget.

Identifiers: Bulk aerodynamic method, Discriminant analysis.

Data were collected during the 1971-1972 snowfall season for the Lake Huron basin. The bulk aerodynamic approach, as formulated by Priestley(1959), was utilized to estimate the daily average flux of heat and moisture over the lake. It was hypothesized that discriminant analysis could be employed to determine the threshold value (discriminant index) of the energy flux which is necessary for the occurrence of the lake-effect snowfall system. To determine the validity of this threshold value, the discriminant index was applied to a series of historical data. The results of this analysis indicated that the discriminant index could be utilized to forecast lake-effect snowfall days. (Jones-ISWS)

**THE COMPOSITE ROUGHNESS OF ICE COVERED STREAMS,**
Iowa Inst. of Hydraulic Research, Iowa City.
M. S. Uzuner.
Journal of Hydraulic Research, Vol 13, No 1, p 79-102, 1975. 8 fig, 2 tab, 7 ref. NSF Grant GK-35918X, Army Contract DACW25-72-C-0012.

Descriptors: *Hydraulics, *River flow, *Equations, *Ice cover, *Flow resistance, Streamflow, Resistance, Ice, Hydraulic radius, Winter, Drag, Streams, Roughness(Hydraulic), Friction.
Identifiers: Friction factors.

The various techniques proposed for calculating the composite roughness of ice-covered streams were reviewed and evaluated. Evaluation stressed the roughness formula used and the method of dividing the flow into bed and ice cover affected portions. A graph was presented to assist in application of Carey's method. The various predictors were compared and their application was discussed. The procedures proposed by Hancu and Larsen were recommended. Hancu's method was preferred because it used the Darcy-Weisbach friction factor. (Adams-ISWS)

**HURONIAN GLACIATION AND POLAR WANDER FROM THE GOWGANDA FORMATION, ONTARIO,**
Windsor Univ. (Ontario). Dept. of Geology.
D. T. A. Symons.
Geology, Vol 3, No 6, p 303-306, June 1975. 4 fig, 2 tab, 42 ref.

Descriptors: *Glaciation, *Geology, *On-site investigations, *Canada, Lake Huron, Evaluation, Sedimentary rocks, Diagenesis, Polar regions, Paleosols.
Identifiers: *Paleoaphebian glaciation, *Gowganda formation, Ontario, Elliot Lake, Paleomagnetic analysis, Paleoaphebian polar wander.

The origin of the till-like conglomerate of the Huronian Gowganda Formation is controversial. The argument centers on whether the conglomerate was deposited directly from the ice as a normal till in a glacial polar climate or whether the boulders were ice rafted and dropped into sediments deposited around an ice sheet in a periglacial subpolar climate. Paleomagnetic analysis provides a direct geophysical method to locate the pole position at the time of deposition and thus helps distinguish the hypotheses. The paleomagnetism of sedimentary rocks from the Huronian Gowganda Formation was studied for 16 sites near Elliot Lake, Ontario, in the Southern Geologic province. The rocks retain a stable remanence acquired during diagenesis some 2.29 billion years ago. The calculated paleolatitude of 62 degrees favors a polar glacial till mode of deposition for the thick tillite members, rather than a subpolar periglacial dropstone mode. The Gowganda pole at lat 65 degrees N, long 123 degrees W indicates that either the ice cap was much larger than now thought or the Bear and Slave provinces were separated from the Churchill, Superior, and Southern provinces in Paleoaphebian time. The pole also requires a radical change in previously published Paleoaphebian polar wander paths. (Humphreys-ISWS)

## 2D. Evaporation and Transpiration

**EVAPORATION FROM WATER SURFACES IN CALIFORNIA,**
California State Dept. of Water Resources, Sacramento.
J. D. Goodridge.
Bulletin 73-1, May 1974. 173 p, 3 tab, 12 ref, 2 plates.

Descriptors: *Evaporation, *Evaporation pans, *California, *Stations, Environment, Water policy, Management, Water resources, Irrigation water, Drainage, Conservation, Vegetation effects, Boundary layers, Wind velocity, Solar radiation, Planning, Arid climates, Data collections, Air-water interfaces, Free surfaces.
Identifiers: Upwind fetch.

Monthly total evaporation data were provided as reported by observers operating evaporation pans throughout California. It was the basic data appendix to Bulletin No. 73, 'Evaporation from Water Surfaces in California (1959).' It supplemented data in Bulletin 54-A, 'Evaporation from Water Surfaces in California; Basic Data (1948),' and reports in the Bulletin No. 113 series which dealt with vegetative water use and included considerable evaporation information on well-exposed Class A evaporation pans. Major drainage provinces, the hydrographic units lying within each, and the general geographic location of evaporation stations in the state were identified. Information on latitude, longitude, elevation, period of record, and pan environment for each station was given. Total evaporation data for each station was tabulated by months for each year within the period of record. A section on the nature of evaporation and factors affecting pan evaporation was included. (Roberts-ISWS)

**AVERAGING ERRORS IN MONTHLY EVAPORATION ESTIMATES,**
Alberta Univ., Edmonton. Dept. of Geography.
K. D. Hage.
Water Resources Research, Vol 11, No 2, p 359-361, April 1975. 2 tab, 6 ref.

Descriptors: *Evaporation, *Climatology, *Estimating, Temperature, Humidity, Environment, Wind velocity, Vapor pressure, Model studies, Hydrology, Heat flow, Latent heat, Weather, Data processing, Water temperature, Diffusion.
Identifiers: *Averaging errors, Dalton-type formula, Nonlinearity errors, Covariance, Taylor series, Clausius-Clapeyron equation, Biometeorology, Sensible heat flux.

The problem of computing evaporation from monthly mean values of temperature, relative humidity, and wind was considered with specific reference to a Dalton-type evaporation formula. Leading contributions due to nonlinearities, covariances, and their interactions were identified separately by expanding saturation vapor pressure as a Taylor series in temperature with the use of the Clausius-Clapeyron equation. A truncated form of the expansion was tested by using observations from a land station. A crude model of diurnal variations in air temperature, relative humidity, and wind speed was used to predict nonlinearity and covariance evaporation errors from monthly mean observations at 2 times per day. The model appeared to be accurate to within plus or minus 5% in warm seasons months but failed in winter when diurnal variability was negligib comparison with air mass changes in weathe ments at mid-latitude continental locat Covariance and nonlinearity errors did not pensate each other in winter and averaging e could reach 20-25%. (Roberts-ISWS)

**WORLD MAPS OF POTENT EVAPOTRANSPIRATION, PLANT DEVEL MENT, AND SPRING GREENING AND TUMN BROWNING OF VEGETATION, BA ON THE SOLAR THERMAL UNIT MODEL,**
Montana State Univ., Bozeman. Dept. of P and Soil Science.
J. M. Caprio.
Research Report 60, June 1974. 26 p, 6 fig, 5 NASA NAS 5-21781.

Descriptors: *Evapotranspiration, *Solar ra tion, *Maps, Temperature, Plant growth, Veg tion, Alfalfa, Harvesting, Phenology, mosphere, Spring, Autumn, Lilac, Model studi Identifiers: *Potential evapotranspiration, *S thermal unit model, Green wave passage, Bro wave passage, Langley degree days.

It was suggested that the development of m plants, rate of potential evapotranspirati vegetative greening in the spring (green wave), possibly vegetative senescence in the autu (brown wave) are associated largely with the so radiation-atmospheric temperature interaction pressed as Solar Thermal Units (STU). These w defined as the product of the mean daily tempe ture in degrees Fahrenheit minus a threshold te perature of 31F times the daily total solar radiati on a horizontal surface (global radiation) in ca ries per square centimeter. A day with a mean te perature of 61F and total solar radiation of 5 calories per square centimeter would have 30 (i. 61F-31F) times 500 which equals 15,000 ST (Langley degree days). Six maps were present based on the STU concept for about 300 locatio throughout the world. Isolines tended to paral latitudinal lines, but there was a tendency for t lines to extend northward in the western Pacif and western Atlantic areas because of t moderating effect of the warm Japanese and Gu Currents in northern latitudes. Almost all of t high-producing agricultural areas of the wor were shown to have average annual potenti evapotranspiration of greater than 15 inche (Roberts-ISWS)

**TRANSPIRATION RATES OF CONIFERS,**
Montana Univ., Missoula. Dept. of Botany.
M. J. Behan.
Montana University Joint Water Resource Research Center, Bozeman, Completion Report February, 1974. 50 p, 6 tab, 3 photographs, 3 au toradiographs, 34 ref. OWRT A-015-MONT(1).

Descriptors: *Transpiration, *Douglas Fir trees *Biorhythms, *Water conservation, *Conifers Stomata, Water loss, Coniferdus trees, Carbo dioxide, Diurnal, Humidity, Temperature *Montana.

Research activities on the transpiration rates o conifers are summarized. A study of the fixatior of C02 in the dark by Douglas Fir is described ir detail. Dark C02 fixation and the accumulation of the C02 as organic acids was demonstrated by measurements of ph shifts, thin layer chromatography of needle extracts, and by treatment of seedlings with 14C02. The fixation of C02 in the dark has some advantages for plants growing under water stress as it allows them to fix carbon dioxide at a time when transpiration rates are reduced due to the increased humidity and cooler temperatures which generally occur at night. New Mexico Inst. of Mining and Technology, Socorro.
V. P. Singh.
Journal of Hydrology, Vol 25, No 3/4, p 187-200, May 1975. 7 fig, 4 tab, 19 ref.

Descriptors: *Surface runoff, *Hydrograph analysis, *Model studies, *Rainfall-runoff relationships, Prototypes, Research facilities, Hydrographs, Time series analysis, Unit hydrographs, Time lag, Hydrophase diagrams, Laboratory tests.
Identifiers: *Kinematic wave model, *Nash model, Converging surfaces.

A laboratory study of a kinematic wave model and Nash model was presented for a converging surface. The interdependent behavior of kinematic wave parameters was shown and based on this observation an experimental justification was given for retaining only one parameter in the kinematic wave model. It was observed that an objective function based on minimizing the sum of squares of hydrograph peak deviations is sufficiently adequate for fitting the entire hydrograph. An objective comparison of the two models demonstrated that the kinematic wave model is uniformly better than Nash model in performing hydrograph predictions on the laboratory watershed. (Jess-ISWS)

## 2F. Groundwater

**GOUNDWATER MODELS,**
R. G. Thomas.
Food and Agriculture Organization of the United Nations, Rome, Irrigation and Drainage Paper No 21, 1973. 192 p, 16 fig, 4 tab, 42 ref, 6 append.

Descriptors: *Model studies, *Computer models, *Mathematical models, *Hydrogeology, *Groundwater, *Aquifer management, Hydrologic models, Digital computers, Analog models, Groundwater basins, Groundwater mining, Groundwater resources, Simulation analysis, Arid lands, *Reviews.

The various types of computer models used for groundwater studies are reviewed. Thy hydrogeologic and mathematical concepts needed to enable one to convert actual field data into a model are emphasized. The polygonal model technique, because of its flexibility in many practical groundwater conditions, is described in detail. Only brief reference is made to finite difference methods and to use of programs prepared for the analysis of electronic circuits. A review of present and potential uses of the groundwater model in water resources planning is also presented. Appended are the contents of other papers which enable one to prepare a mathematical model of a groundwater basin for the computer. The publication functions as a manual on the development of the use of the digital computer for groundwater models and on how to prepare any Fortran program for any selected groundwater basin. **GREAT LAKES BASIN FRAMEWORK STUDY: APPENDIX 3--GEOLOGY AND GROUND WATER,**
Geological Survey, Albany, N.Y.
R. M. Waller, and W. B. Allen.
Great Lakes Basin Commission, Ann Arbor, Appendix 3 of Great Lakes Basin Framework Study, 1975. 152 p, 60 fig, 15 tab, 76 ref.

Descriptors: *Water resources, *Groundwater, *Great Lakes region, *Hydrogeology, Water quality, Water yield, Aquifers, Groundwater availability, Groundwater resources.
Identifiers: Great Lakes Basin.

The general geologic framework and groundwater situation throughout the Great Lakes Basin, major problems of quantity and chemical quality of groundwater, and factors to be considered in the conjunctive and beneficial use of the Basin's entire water resources are described. Emphasis is on major aquifer systems because domestic-type supplies are available almost everywhere. The Great Lakes Basin is underlain almost entirely by a thick succession of sedimentary rocks. Glacial and alluvial deposits cover the bedrock. These deposits are as much as 1,100 feet thick, with the thickest deposits generally occurring in Michigan and locally in buried bedrock velleys of New York and Wisconsin. Groundwater is present everywhere throughout the Basin, but in limited quantities in areas where the basement rock is at or near the surface. The most productive aquifers, with well yields as much as 2,500 gpm, occur in unconsolidated, well-sorted sand and gravel deposits, especially where natural recharge from streams or precipitation can occur readily. Unconsolidated aquifers are most widespread in western and central Michigan, northeastern Indiana, and the western part of Wisconsin. Carbonate (limestone and dolomite) aquifers constitute the most common bedrock aquifers in the Basin. They occur along the northern and western shore of Lake Michigan, from Illinois to Cleveland, and along the southern shore of Lake Ontario. A thick sequence of productive sandstone units is present along the western and northern part of the Lake Michigan basin. Chemical quality of groundwater is generally good, although saline, mineralized, or brackish water is present in deep bedrock throughout the Basin, and at shallow depths in a few places. (Knapp-USGS)

**GEOLOGIC AND HYDROLOGIC FEATURES OF INDIAN WELLS VALLEY, CALIFORNIA,**
Geological Survey, Reston, Va.
L. C. Dutcher, and W. R. Moyle, Jr.
Available from GPO, Washington, D.C. 20402, Price $3.75 (paper copy). Water-Supply Paper 2007, 1973. 30 p, 3 fig, 6 plate, 3 tab, 23 ref.

Descriptors: *Groundwater resources, *Groundwater availability, *Hydrologic data, *Hydrogeology, *California, Arid climates, Groundwater basins, Groundwater potential, Water quality, Chemical analysis, Water management(Applied), Planning, Water supply, Water yield, Water wells, Water resources development.
Identifiers: *Indian Wells Valley(Calif), *Mojave Desert.

Groundwater pumpage in Indian Wells Valley, virtually a closed basin in the Mojave Desert of southern California, has gradually increased since 1945 and in 1966 has exceeded the average annual water yield (perennial supply). This report summarizes the principal geologic and hydrologic parameters needed for a detailed quantitative study of the hydrology, including the future development of a groundwater basin model. The groundwater basin contains a single body of groundwater in alluvial deposits locally as much as 2,000 feet thick. The deposits consist mainly of sand and gravel but grade to silt and silty clay beneath the lower parts of the valley surface. Coefficients of transmissivity range from almost zero at the basin margins to about 300,000 gallons per day per foot in the central part of the valley. The maximum developable yield of Indian Wells Valley groundwater basin, under existing conditions, is estimated to be 10,000 acre-feet. The water of best quality occurs in the alluvial deposits of shallow to medium thickness in the western and northwestern parts of the valley and in the deep zones in the central and south-central part of the basin. The dissolved-solids content of the water there is generally less than 600 mg/litre. Water in the shallow deposits beneath the playa areas contains dissolved-solids of more than 1,000 mg/litre. (Woodard-USGS)
W75-09717

**AVAILABILITY OF GROUND WATER IN THE BRANCH RIVER BASIN, PROVIDENCE COUNTY, RHODE ISLAND,**
Geological Survey, Providence, R.I.
H. E. Johnston, and D. C. Dickerman.
Water-Resources Investigations 18-74, December 1974. 39 p, 13 fig, 1 plate, 7 tab, 30 ref.

Descriptors: *Groundwater resources, *Water yield, *Water quality, *Rhode Island, Aquifer characteristics, Well data, Water wells, Chemical analysis, Hydrologic data, Surface-groundwater relationships, Streamflow, Groundwater recharge, Hydrogeology, Groundwater movement.
Identifiers: *Branch River basin(RI), *Providence County(RI).

In the Branch River basin, Providence County, Rhode Island, stratified glacial drift consisting largely of sand and gravel constitutes the only aquifer capable of supporting continuous yields of 100 gpm or more to individual wells. The aquifer covers about a third of the 79 sq mi study area, occurring mainly in stream valleys that are less than a mile wide. Its saturated thickness is commonly 40 to 60 ft; its transmissivity is commonly 5,000 to 8,000 sq ft/day. Potential sustained yield from most parts of the aquifer is limited chiefly by the rate at which infiltration can be induced from streams. If large-scale development of groundwater is not carefully managed, periods of no streamflow may result during dry weather. Potential sustained yield varies with the scheme of well development, and is evaluated for selected areas by mathematically simulating pumping from assumed schemes of wells in models of the stream-aquifer system. Results indicate that sustained yields of 5.5, 3.4, 1.6, and 1.3 mgd can be obtained from the stratified-drift aquifer near Slatersville, Oakland, Harrisville, and Chepachet, respectively. A larger groundwater yield can be obtained, if periods of no streamflow along reaches of principal streams are acceptable. Quality of water in the stream-aquifer system is suitable for most purposes; the water is soft, slightly acidic, and generally contains less than 100 mg per litre of dissolved solids. (Woodard-USGS)

**HYDROLOGIC ANALYSIS OF THE VALLEY-FILL AQUIFER, NORTH PLATTE RIVER VALLEY, GOSHEN COUNTY, WYOMING,**
Geological Survey, Cheyenne, Wyo.
M. A. Crist.
Water-Resources Investigations 3-75, March 1975. 60 p, 11 fig, 4 plate, 11 tab, 25 ref.

Descriptors: *Irrigation wells, *Aquifer characteristics, *Hydrologic budget, *Model studies, *Wyoming, Digital computers, Forecasting, Water wells, Pumping, Water yield, Groundwater recharge, Surface-groundwater relationships, Water balance, Hydrologic data, Observation wells.
Identifiers: *Goshen County(Wyo).

The North Platte River valley in Goshen County, Wyo., is a highly productive agricultural area where most crops are irrigated principally with surface water. More than 200 irrigation wells in the valley fill are pumped for supplemental irrigation supplies. Groundwater in storage in the valley fill is estimated to be about 1,700,000 acre-feet. Recharge to groundwater from precipitation and imported irrigation water amounted to about 73,000 acre-feet and is nearly equal to the 76,000 acre-feet estimated as the amount of groundwater contributed to the North Platte River during the 1-year study. The hydrologic system of the valley fill is simulated with a digital model. Monthly net head change in the aquifer and the monthly net change in the groundwater discharge to the North Platte River was used to calibrate the model. The digital model developed during this investigation can be used to predict the effect of change in stress that might be applied to the system. (Woodard-USGS)

Identifiers: *Lincolnshire Limestone(England), Alternating direction method, Central difference approximation, Backward difference approximation, Iterative methods, Initial conditions, One-dimensional analysis, Two-dimensional analysis, Errors, Time steps, Mesh spacing, Convergence, Response time.

An aquifer which is partly confined and partly unconfined, presents particular difficulties when studied by numerical methods on a digital computer. By considering a one-dimensional example for which analytical solutions were available, it was found that central difference methods, such as the alternating direction method, are unsatisfactory, whereas backward difference methods give reliable results. An examination of a complex two-dimensional problem provided information about the size of time steps, convergence parameters, and the number of iterations required. (Visocky-ISWS)

**HYDROGEOLOGY OF THE WATERWAYS-WINEFRED LAKE AREA, ALBERTA,**
Alberta Research, Edmonton.
G. F. Ozoray.
Report 74-2, 1974. 18 p, 1 fig, 70 ref.

Descriptors: *Hydrogeology, *Canada, *Groundwater movement, Safe yield, Aquifer characteristics, Water table, Muskeg, Springs, Mineral water, Perched water, Well data, Test wells, Geochemistry, Permafrost, Discharge(Water), Transmissivity.
Identifiers: *Alberta, Quasi-spring, Climafrost.

The hydrogeology of the uppermost 1000 feet of strata in the Waterways and Winefred Lake areas was described. Maps and profiles were constructed from limited existing data and from data collected by field survey and drilling operations. The 20-year safe yields are mostly over 5 imperial gallons per minute (igpm), reaching 25-100 igpm for over half of the map area. These yields are available within 500 feet of the surface. A practical limiting factor on groundwater use is quality, because deeper groundwater is saline. In many places, saline water discharges to the surface. A semidiffuse groundwater discharge feature ('quasi-spring') describes sources of creeks at definite spring-like points in groundwater-fed muskegs. The quasi-springs are climatically and topographically controlled discharge features of climafrost zones. Widespread muskeg development exists in the area and degeneration of the groundwater flow-systems is noted. (Visocky-ISWS)

**EDAPHIC MICRO-TUBULAR CONTINUOUS FLOW IRRIGATION IN CANADA,**
Department of Agriculture, Summerland (British Columbia).
D. S. Stevenson, and R. S. Tait.
In: Proceedings of the Second International Drip Irrigation Congress, p 86-90 (1974). 3 fig, 4 tab.

Descriptors: *Soil water movement, *Canada, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Microtubing.

A soil's ability to transfer water horizontally relative to vertical drainage is its most important characteristic in trickle irrigation. Water applied to a soil at a single point will move laterally and vertically. The shape of the resulting half sphere will depend upon the ratio of saturated conductivity to unsaturated conductivity of any particular soil. The limit to horizontal movement before drainage becomes excessive determines that area that can be irrigated with one dripper. Rooting depth of the crop imposes a limit to the area over which water will spread before an excess of it becomes drainage. Evapotranspiration (ET) over the area so defined thus determines the continuous flow from the dripper. Areas and ET are easily equated to provide dripper flows in g.p.h. The areas provide the dripper spacing for uniform irrigation. Microtubing of varying sizes and lengths as emitters provides flow control at the emitters for both level and sloping land. Seasonal changes in irrigation requirements (ET) are satisfied by alterations in line pressures as needed. (See also W75-09423) (Skogerboe-Colorado State)

**LINEARIZED MOISTURE FLOW SOLUTIONS FOR POINT, LINE, AND STRIP SOURCES,**
Arizona Univ., Tucson.
A. W. Warrick, and D. O. Lomen.
In: Proceedings of the Second International Drip Irrigation Congress, p 228-233, (1974). 3 fig, 1 tab, 12 ref.

Descriptors: *Soil water movement, Mathematical studies, Irrigation system, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, Point sources, Line sources, Strip sources.

Solutions and numerical results are given for the time-dependent, linearized moisture flow equation for point, line and strip sources. The linear form is attained by assuming an unsaturated hydraulic conductivity of the form K = ko exp (alpha h) with Ko and alpha constants and with h the pressure head. In addition, the derivative of K with respect to the volumetric water content is taken as a constant. Numerical results include: (1) spatial distribution of the matric flux potential for 6 times including a comparison of 2 flow rates for a point source; (2) pressure head distribution near a single point source under cyclic conditions; (3) pressure head distribution for 2 point sources under cyclic conditions, and (4) moisture distribution patterns near line and strip sources. The major advantage of using the linearized forms is that solutions for simplified geometries may be superimposed both in time and space to simulate complex geometries and inputs of water. The major disadvantage of the non-linear nature of the soil-hydraulic functions is lost. For cyclic moisture regimes at a high frequency, it is assumed the water content fluctuation of any point will be relatively small and the linearizing assumptions are realistic. **TRICKLE IRRIGATION DESIGN FOR OPTIMAL SOIL WETTING,**
Utah State Univ., Logan.
J. Keller, and D. Karmeli.
In: Proceedings of the Second International Drip Irrigation Congress, p 240-245, (1974). 2 fig, 2 tab, 3 ref.

Descriptors: *Irrigation design, Soil moisture, Evapotranspiration, Flow rates, Design criteria, Economics, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

The general relationship between the percentage area wetted and crop productivity is discussed and the recommended trickler spacing for achieving the desired soil wetting is presented. The number of operating blocks (stations or sub-units) required to obtain the desired soil wetting is developed considering ET demands and system capacity constraints. The effect of the number of blocks on hydraulic features of the network and the relative economic effect is considered. (See also W75-09423)

**SOIL MOISTURE DISTRIBUTION AND WETTING PATTERN FROM A POINT SOURCE,**
Arizona Univ., Yuma.
R. L. Roth.
In: Proceedings of the Second International Drip Irrigation Congress, p 246-251, (1974). 4 fig.

Descriptors: Wetting, *Water levels, Flow rates, *Soil water, Irrigation, Irrigation systems, Agriculture, *Soil moisture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Wetting patterns, Point source.

Soil moisture distribution and wetting pattern tests were conducted using a point source of virgin desert sandy soil. The purpose of these studies was to characterize the extent of moisture movement and distribution within the wetted volume. The flow rates tested were approximately 3.8, 7.6, and 15.2 liters per hour (1, 2, and 4 gph) for durations of 1, 3, 6, 12, 24, and 48 hours. At the completion of each test, a pit was dug which exposed the maximum vertical diametral plane of the wetted volume. Measurements were made to define the maximum wetted area. Soil moisture measurements were made at each node point of a 15.2-centimeter (6-inch) grid imposed on the maximum wetted area. Soil cores were taken at 15.2-centimeter intervals along the line of maximum horizontal water movement. These cores were used to determine bulk density, soil texture, permeability, and moisture release characteristics. A complete soil profile description was also made of each test site. For the tests conducted the total volume of soil wetted was more a function of the amount of water applied than time of application. Maximum horizontal movement was greater than maximum vertical movement for volumes of water less than 190 liters (50 gallons). Greater maximum vertical movement occurred at volumes of water more than 190 liters. Water within the wetted volume was determined to be at tensions between 100-140 centimeters of water. **SOIL MOISTURE DISTRIBUTION AND DEPLETION IN AN APPLE ORCHARD IRRIGATED BY TRICKLERS,**
Hebrew Univ., Rehovoth (Israel).
I. Levin, R. Assaf, and B. Bravo.
In: Proceedings of the Second International Drip Irrigation Congress, p 252-257, (1974). 4 fig, 1 tab, 4 ref.

Descriptors: *Irrigation practices, *Soil water movement, Irrigation systems, Frequency, Orchard, Apples, Crop response, Irrigation, Agriculture, *Soil moisture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Four treatments of trickle irrigation methods were applied in an apple orchard on heavy soil. The treatments differed in water discharge rate of the tricklers (4 and 8 liter/hour), distances between the outlets on the lateral lines (1.25 m and 2 m) and irrigation frequency (1, 3 and 7-day intervals). In all treatments the amount of water applied was on the basis of 10 mm/day consumptive use. Soil moisture content fluctuations in the upper 60 cm layer before, during and after irrigation were frequently measured. The distance wetted from the trickler was linearly dependent on the duration of the single irrigation and the discharge rate of the trickler: 65 cm, 80 cm, and 120 cm after 14, 24 and 70 hours of irrigation at a 4 liter/hour discharge rate, respectively; and 120 cm after 40 hours at a 8 liter/hour discharge rate. The soil moisture content at the end of the irrigation dropped gradually from under the trickler to the farthest distance wetted, where about 90% of field capacity was reached. After the termination of the irrigation, the soil moisture content depleted gradually to the level before the beginning of the irrigation - at all distances from the tricklers and in all treatments. The results indicate that there was deep drainage below the root zone in the area under the tricklers in all treatments. (See also W75-09423) (Skogerboe-Colorado State)

Transactions of the American Society of Agricultural Engineers, Vol 18, No 2, p 281-287, March-April 1975. 9 fig, 27 ref, 1 append.

Descriptors: *Simulation analysis, *Mathematical models, *Porous media, *Infiltration, *Soils, Computer programs, Model studies, Management, Darcys law, Dispersion, Saturated flow, Unsaturated flow, Solutes, Saturated soils, Moisture content, Homogeneity, Steady flow, Unsteady flow, Percolation, Isotropy, Ion transport.
Identifiers: *Vertical infiltration.

A simulation model was developed to simulate miscible displacement of a conservative solute during one-dimensional vertical infiltration into a homogeneous, isotropic, porous media. Solutions of transient flow problems were obtainable as well as steady state problems because it was not necessary to assume constant solution fluxes to solve the dispersion equation. The accuracy of the simulation model was tested by comparison with analytical solutions, experimental data, and other simulation results from the literature. Comparisons provided excellent agreement in all cases except for Warrick's field experimental data. Considering the nonhomogeneous field conditions encountered in Warrick's experimental plot, the simulated results were considered to be good. (Sanderson-ISWS)

**SOIL MOISTURE SENSING SYSTEM,**
C. Matlin.
US Patent No 3,882,383, 4 p, 9 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 934, No 1, p 382, May 6, 1975.

Descriptors: *Patents, *Soil moisture, Moisture content, Soil pressure, Electrical resistance, Electrodes, Equipment, *Instrumentation.

The invention relates to an electrical resistivity method for testing the moisture content of soil. The electrical resistivity of the soil is sensed by a soil moisture sensor having two electrodes in direct contact with the soil under test. This combination of sensor and associated soil become a variable resistive component of an electronic network whose output is used to energize either a meter for quantitative measurements or a miniature lite bulb for qualitative monitoring. The soil moisture sensor features a floating/breathing electrode to compensate for the adverse effects of unpredictable variations in contact pressure between the sensor electrodes and associated soil. The electrical circuitry features a means for depolarizing sensor electrodes; a means for assuring against electrical ground loops; and a solid state circuit for translating soil moisture into the light intensity of a miniature lite bulb. Soil Science Society of America Proceedings, Vol 39, No 1, p 158-160, January-February 1975. 3 fig, 1 tab, 2 ref.

Descriptors: *Rainfall simulators, *Simulated rainfall, *Infiltration, *Soil erosion, Soil physics, Laboratory equipment, Soil physical properties, Research facilities, Equipment, Simulation analysis, Impact(Rainfall), Raindrops.

A laboratory rainfall simulator with high intensity precision and nearly uniform rain distribution was developed for studying rain infiltration into soils and soil detachability by rainfall. The rainfall simulator consists of an assembly of closely packed hypodermic syringes with plungers driven by a common plate. Rainfall intensity is determined by controlling the plunger speed at variable motor speeds. Rain is distributed uniformly by superpositioning three independent motions-rotation, and perpendicular and linear motions in the horizontal plane. Rainfall intensities were generally within 2.5% of predicted values. The average coefficient of variation of rain distribution for various rainfall intensities over a 100 sq cm area was reduced from 31.9% with no motion to 8.5% with rotation and linear motions. I. P. Abrol, and I. S. Dahiya.
Geoderma, Vol 11, No 4, p 305-312, July 1974. 3 fig, 2 tab, 5 ref.

Descriptors: *Saline soils, *Land reclamation, *Gypsum, *Chemical precipitation, *Arid climates, Carbonates, Sodium, Calcium, Leaching, Soil amendments, Infiltration, Flow rates, Leachate, Saturation.

Reclamation of saline-sodic soils requires that excess exchangeable sodium on the clay complex be replaced by the more favorable divalent calcium ion and that excess soluble salts present in the soil also be leached from the root zone. The effect of flow rate and concentration of calcium the leaching solution on the extent of carbonate precipitation was studied on a highly saline-sodic soil. Precipitation of soluble carbonates in the soil increased with increasing flow velocity and concentration of calcium in the leaching solution. These results are discussed in terms of actual flow processes at the wetting front. The results suggest that by controlling the extent of carbonate precipitation, the quantity of soil amendments containing calcium necessary for reclamation of sodic soils rich in soluble carbonates can be reduced considerably. In many cases the amount of gypsum required by these soils is often overestimated because a large portion of the soluble carbonates is leached out without reaction with the added gypsum. ## 2I. Water In Plants

**EFFECT OF ROOT TEMPERATURE AND HUMIDITY ON THE DISTRIBUTION OF CA IN APPLE AND SUNFLOWER SEEDLINGS,**
Washington State Univ., Pullman. Dept. of Horticulture.
C. G. Woodbridge.
Z Pflanzenernaehr Bodenkd, Vol 133, No 1/2, p 64-69, 1972.

Descriptors: *Calcium, *Apples, Seedlings, Temperature, Humidity, Distribution, *Root systems.
Identifiers: *Sunflower.

Using 45Ca, the effects of root temperature and relative humidity on Ca distribution in apple and sunflower seedlings were studied during a 24 h experimental period. At 5C Ca accumulation in apple stems and leaves was much less than at 15C, 20C, 30C and 40C. The ratio of Ca accumulation in the stems and leaves was constant Maximum translocation occurred when root temperature was between 15 and 30C. In sunflower stems there was less accumulation of Ca at 5C and 40C than at other temperatures. In the basal leaves and tops more Ca accumulated at 20C and 30C than at 5C, 15C or 40C. The ratio between Ca accumulation in the basal leaves or tops and that in the stems varied with temperature. In apple seedlings less Ca was translocated than in the sunflower seedlings at all temperatures. The effects of humidity, 40% and 90%, on translocation were small.--Copyright 1974, Biological Abstracts, Inc.

**DROUGHT CRACK ON WESTERN WHITE PINE IN NORTHERN IDAHO,**
Forest Service (USDA), Moscow, Idaho. Intermountain Forest and Range Experiment Station.
R. D. Hungerford.
For Sci, Vol 19, No 1, p 77-80, 1973, Illus.

Descriptors: *Idaho, *White pine trees, *Droughts, *Moisture stress, Moisture deficit, Trees.
Identifiers: Tree cracks.

In Sept. of 1967 1 western white pine (Pinus monticola) in Northern Idaho had external cracks which were not apparent 3 mo. earlier. This fact together with observation of climatic data, site conditions, and wood anatomy suggest that cracking resulted from moisture stress. Inherent structural weaknesses of the wood apparently predisposed the tree stem to cracking during the drought.--Copyright 1973, Biological Abstracts, Inc.

**SEE GERMINATION RESPONSE TO SUBSURFACE IRRIGATION DEPTH,**
Agricultural Research Service, Brawley, Calif.
L. S. Willardson.
In: Proceedings of the Second International Drip Irrigation Congress, p 178-182, (1974). 4 fig, 2 ref.

Descriptors: *Subsurface irrigation, *Cotton, *Alfalfa, *Germination, Crop response, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Line sources.

A line source subsurface irrigation system was installed at 0, 2.54, 5.08, 10.16, and 20.32 cm depths in a sandy silt soil. The electrical conductivity of the soil varied between 10.4 and 16.2 mmhos per cm. Cotton and alfalfa were used to determine the effect of depth of placement of the seeds and water source on germination. (See also W75-09423) (Skogerboe-Colorado State)

**EFFECTS OF DRIP IRRIGATION ON SOIL-WATER-PLANT RELATIONSHIP,**
Sao Paulo Univ. (Brazil). Escola Superior de Agricultura Luiz de Queiroz.
H. A. Manfrinato.
In: Proceedings of the Second International Drip Irrigation Congress, p 446-451, (1974). 1 fig, 4 tab, 9 ref.

Descriptors: *Infiltration, *Moisture content, *Soil water movement, *Soil-water-plant relationships, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, Soil columns.

Soil columns, prepared in the laboratory, by packing sieved and air dried soil into cylinder tubes were used to study the distribution of moisture content at the moment of infiltration. Drops of water, were applied simulating rain, at eight different intensities, called treatments, with two repetitions. When the water application rate was continually reduced throughout the treatments, the moisture content also diminished and vice versa. It was also concluded that when the rain application intensity was decreasing to a very small rate, the moisture content had such a slow reduction, as if going to a limit, which was found to be the soil field capacity. **THE RELATION BETWEEN DRIP IRRIGATION, PHYTOPHTHORA ROOT ROT OF AVOCADO, AND FUNGICIDES,**
California Univ., Riverside.
G. A. Zentmyer, F. B. Guillement, and E. L. V. Johnson.
In: Proceedings of the Second International Drip Irrigation Congress, p 512-514, (1974).

Descriptors: *Diseases, *Disease resistance, *Fungicides, Irrigation practices, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Avocado.

Studies have been initiated to determine the effect of drip irrigation on development, spread and control of Phytophthora root rot of avocado caused by Phytophthora cinnamomi. In one test in naturally infested soil, development of Phytophthora root rot of avocado seedlings was considerably slower under drip than under sprinkler irrigation. There were also indications of less rapid spread of the fungus from infested into noninfested soil under the drip, as compared with the sprinkler regime. At the end of the first year of the experiment, 6 of 12 seedlings were still healthy in soil infested with P. cinnamomi when irrigated with a drip system, compared with 2 healthy seedlings of 12 irrigated with spitters. A number of soil fungicides have been tested in the greenhouse for possible use in drip systems, by applying frequent applications (every other day or every fourth day) to avocado seedlings growing in soil infested with Phytophthora cinnamomi. The best control of the disease has been obtained with ethazol (5-ethoxy-3-trichloremethyl-1, 2, 4-thiadiazole) chemicals for incorporation in drip systems is still in the early stages. One field plot has been established with Terrazole applied in a drip system to 10-year old avocado trees with Phytophthora root rot, and also to young trees replanted in infested soil. **TRITIATED WATER TURNOVER RATE IN RODENTS: DESERT AND MOUNTAIN,**
Nevada Univ., Reno. Desert Research Inst.
M. K. Yousef, H. D. Johnson, W. G. Bradley, and S. M. Seif.
Physiological Zoology, Vol 47, No 3, p 153-162, July, 1974. 5 fig, 3 tab, 20 ref.

Descriptors: *Rodents, *Water consumption, *Animal physiology, *Moisture stress, *Animal metabolism, Arid lands, Water utilization, Deserts, Respiration, Water requirements.
Identifiers: *Tritiated water turnover rate.

It has been technically difficult in the past to determine the daily water exchange between an animal and its surroundings. The use of tritiated water has proved useful for estimating water-turnover rate, k, where k represents the fraction of body-water pool turned over per unit of time. Assuming that animals are normally in a state of dynamic equilibrium, the measurement of k should equal daily water requirements. Eight species of rodents, three species each of kangaroo rats and ground squirrels and one species of wood rat and chipmunk, representing three families, were used in this study. These species are characteristic of a range of habitats from low desert to montane forest. The water turnover rate varied widely between the species. This difference in rate appears unrelated in most instances to phylogeny but is probably influenced by ecologic distribution, diet, behavior, and metabolic rate. (Bowden-Arizona)

## 2J. Erosion and Sedimentation

**INFLUENCE OF SURFACE AND NEAR-SURFACE CALICHE DISTRIBUTION ON INFILTRATION CHARACTERISTICS, LAS VEGAS, NEVADA,**
Nevada Univ., Reno. Desert Research Inst.
R. L. Cooley, G. W. Fiero, Jr., L. H. Lattman, and A. L. Mindling.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 379, $4.25 in paper copy, $2.25 in microfiche. Center for Water Resources Research, Publication No 20, December 1974, 54 p, 14 fig, 6 tab, 10 ref. OWRT B-062-NEV(1). 14-31-0001-3910.

Descriptors: *Aprons, Artificial recharge, Engineering structures, Flood control, Runoff, *Nevada, *Caliche, *Distribution, *Infiltration, Sedimentation.
Identifiers: *McCullough Range(Nev).

Objectives were (1) to determine the distribution and infiltration characteristics of caliche on McCullough Fan, a large pedimented alluvial fan bordering the McCullough Range south of Las Vegas, Nevada and (2) to investigate the development of caliche on ephermeral stream channels and interfluves on the fan. Field study indicated that caliche development and distribution are related to three erosion surfaces and to three lithologic units. Underlying the uppermost erosion surface is a fine-grained petrocalcic horizon riddled with solution-widened fractures and which contains almost no coarse clastics. The middle caliche layer mainly contains boulders, cobbles and pebbles with a variable degree of cementation. The lower surface is made up of discontinuous calcic horizons and case-hardened banks. Caliche influences infiltration mainly as gully-bed cementation horizons in the medial and distal portions of the fan. Infiltration tests were conducted establishing that interconnected fractures in the vertical fractured caliche provide a direct avenue for infiltrated water to pass through, however, most precipitation does not pass through the upper sediments.

Bouldery caliche acts as a relatively impermeable barrier to route water laterally to exit points on the walls of deep gullies. (See also W73-10721) (Fallon-Nevada)

**CHANNEL RESPONSES TO ARTIFICIAL STREAM CAPTURE, DEATH VALLEY, CALIFORNIA,**
California Inst. of Tech., Pasadena. Div. of Geological and Planetary Sciences.
D. Dzurisin.
Geology, Vol 3, No 2, p 309-312, June 1975. 4 fig, 5 ref.

Descriptors: *Channel erosion, *Channel morphology, *Streams, Erosion, Erosion rates, Deposition(Sediments), Headward erosion, *California, Streamflow, Sediments, Stream stabilization, Debris avalanches, Geomorphology, Ephemeral streams, Slopes, Profiles.
Identifiers: *Stream capture, *Channel adjustments, Vertical erosion, Death Valley(Calif).

Artificial capture of Furnace Creek Wash by Gower Gulch in 1941 caused channel responses in three separate reaches of this integrated ephemeral stream system: (1) upper Furnace Creek Wash, (2) Gower Gulch channel, and (3) Gower Gulch fan. At the diversion point, vertical erosion had lowered the brink of a 25-m nickpoint by approximately 3.2 m by 1974. Upstream from the nickpoint, Furnace Creek Wash had responded with headward dissection for 2.7 km and removal of debris at a mean rate of about 4000 cu m per year. The mean slope of the Gower Gulch channel had been lowered throughout by erosion due to drastically increased discharge, producing debris at a mean rate of about 2000 cu m per year. Dissection of the upper part of the Gower fan to a maximum depth of 5.7 m and production of debris at a mean rate of about 400 cu m per year are attributed to high stream velocities and increased discharge. In the absence of further intervention, evolution of the system during the next few hundred years is likely to be characterized by the following: (1) increasing depth and extent of headward dissection in Furnace Creek Wash and its tributaries upstream from the diversion point and (2) readjustment of the Gower fan profile in response to accumulation of coarse diverted debris. **DYNAMICS OF TURBIDITY PLUMES IN LAKE ONTARIO,**
Geological Survey, Reston, Va.
E. J. Pluhowski.
Open-File report 75-249, May 1975. 59 p, 34 fig, 2 tab, 13 ref.

Descriptors: *Sediment transport, *Lake Ontario, *Aerial photography, *Turbidity currents, Tracers, Erosion, Inflow, Beach erosion, Littoral drift, Currents(Water), Remote sensing, Satellites(Artificial), Methodology, Tracking techniques, Data collections.
Identifiers: *Turbidity plume tracers.

Field activities and image analyses focused on the 275-kilometer-long south shore of Lake Ontario. LANDSAT-1 images were screened for large-scale turbidity features. Ground-truth measurements of temperature, turbidity, and several meteorologic parameters were obtained at selected sites along the south shore of the lake, at times coinciding with satellite overpasses. Large well-defined turbidity plumes were frequently observed at the mouths of the Niagara River, Welland Canal, Oswego River, and Genesee River. Although generally confirming the existence of a west-to-east littoral current along the south shore, notable exceptions to the prevailing direction were detected, especially in the Rochester embayment and in the vicinity of the Niagara River plume. Based on plume characteristics during the shipping season, the Welland Canal yields the highest concentrations of suspended matter to Lake Ontario along its south shore. Three high-risk beach-erosion zones were identified in the images, (1) Fifty Mile Pt., Ontario to Thirty Mile Pt., N.Y., (2) the Rochester embayment, and (3) Sodus Bay to Nine Mile Pt. (Woodard-USGS)

Identifiers: *Griggs and Steele Counties(N Dak).

The glacial deposits in Griggs and Steele Counties, N. Dak., are described in detail. This information should be of value to anyone interested in the distribution of the geologic units that have potential as aquifers. Griggs and Steele Counties, located at the eastern edge of the Williston basin, are underlain by 400 to 2,600 feet of Paleozoic and Mesozoic rocks that dip gently to the west. The Cretaceous Greenhorn, Carlile, Niobrara, and Pierre Formations lie directly beneath the glacial drift, and shale of the Pierre Formation is exposed in several places along the Sheyenne River. The Pleistocene Coleharbor Formation, which covers most of the area, consists mainly of glacial, fluvial, and lake sediment. The Coleharbor Formation averages 200 to 300 feet thick, but it is as much as 550 feet thick in some of the buried valleys. The Holocene Walsh Formation occurs in parts of the area, chiefly sloughs and river bottomland. It consists mainly of alluvial and eolian sediment. As the Late Wisconsinan glacier in eastern North Dakota thinned and receded eastward, large areas of Griggs County were washed by water flowing from the glacier. Continued withdrawal of the glacier resulted in ponding of melt water in parts of the two counties. These and other ponds tended to coalesce at lower and lower elevations, eventually forming Lake Agassiz, which flooded part of eastern Steele County. (Woodard-USGS)

Journal of the Geotechnical Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No GT1, Paper 11078, p 51-66, January 1975. 16 fig, 3 tab, 18 ref, 2 append. NSF Grant GK40283.

Descriptors: *Erosion, *Pore pressure, *Soil erosion, *Shear stress, *Flocculation, Sodium, Soil structure, Clays.
Identifiers: *Fluid influences, *Critical shear stress, Geotechnical engineering, Deflocculating.

Hydraulic erosion studies were carried out with a modified rotating-cylinder apparatus on saturated Yolo loam soil at different pore fluid compositions. The critical shear stress required to initiate erosion was shown to be controlled by the structure of the soil as influenced by the pore fluid composition. The critical shear stress was also shown to be dependent on the composition of the eroding fluid. The structure of the soil and the osmotic influences caused by the differences in the electrolyte concentration of the pore and eroding fluids were considered to explain the mechanism of surface erosion. **SEDIMENT YIELDS FROM INTERMEDIATE-SIZED STREAM BASINS IN SOUTHERN ALBERTA,**
Alberta Univ., Edmonton. Dept. of Geography.
H. J. McPherson.
Journal of Hydrology, Vol 25, No 3/4, p 243-257, May 1975. 4 fig, 4 tab, 12 ref.

Descriptors: *Sediment yield, *River basins, *Hydrologic data, *Canada, Suspended solids, Dissolved solids, Regression analysis, Sediment load, Geomorphology, Rivers, Hydrology, Sedimentation, Sediment transport, Sampling, Watersheds(Basins).
Identifiers: *Alberta.

Suspended sediment yields were determined for 36 basins and dissolved sediment yields were determined for 21 intermediate-sized stream basins in southern Alberta, Canada. Calculation of long-

term mean sediment loads was based on the establishment of sediment rating-curves for gaging stations at the basins outlets and the construction of a sediment duration curve from sediment rating and flow duration curves. Mean yearly suspended sediment export ranged from 12.55 tons/sq mi to 576.9 tons/sq mi with 58% of the basins yielding less than 200 tons/sq mi. These rates were in close agreement with values reported by others for western Canada. Dissolved sediment yields ranged from 0.89 to 286.6 tons/sq mi per year with 50% of the catchments contributing less than 50 tons/sq mi per year. Relationsips between sediment yields and geomorphic and hydrologic variables were subjected to regression analysis. Highly significant relationships were established between sediment yields, unit mean discharge, mean annual discharge, local relief, elevation, and mean land slope. Mean land slope and unit mean discharge were the variables which gave the highest correlation coefficients. Predictive equations were developed which allow sediment yields to be determined for ungaged catchments. (Adams-ISWS)

Geological Society of America Bulletin, Vol 86, No 5, p 651-664, May 1975. 9 fig, 1 tab, 72 ref. ONR Contract N00014-67-A-0108-004, NSF Grant GA-27281.

Descriptors: *Sediments, *Seismic studies, Pacific coast region, Sediment distribution, Structural analysis, Marine geology, Oceans, Measurement.
Identifiers: *Seismic reflection, *Japan Sea, *Sonobuoys, Profiler, Marginal ocean basins, Abyssal plain, Yamato Basin, Sea floor, Seismic refraction.

Seismic reflection (profiler) traverses of the Japan Basin, Yamato Basin, and intervening Yamato Ridge reveal horizontally stratified sediments over weakly stratified sediments. Wide-angle reflection and refraction data from 65 sonobuoy stations made en route gave velocities in the sediments that range from 1.6 to 3.2 km/sec. The results of profiler-sonobuoy measurements combined with the results of earlier two-ship seismic refraction measurements indicated that the Japan Basin and Yamato Basin are underlain by oceanic crust which in turn is covered by sediments (and volcanics) that have built a shallower sea floor than that in the western North Pacific basin. Yamato Ridge appears to be mainly a pile of volcanics resting on an oceanic layer at normal depth. The crust of Yamato Basin may also have been modified to the extent that it has a thicker than normal layer 3 and a low-velocity mantle. Other profiler-sonobuoy data, gathered in the strait between Japan and Korea and across the Japan Sea margin of southwest Japan and northeast Japan, were presented. A number of profiler crossings of Toyama Channel indicated its formation by turbidity currents. Turbidity flows in this channel and in other channels transport sediment to the abyssal plain. Identifiers: *Water escape, *Liquefaction, *Fluidization, Packing, Cross bedding.

Three processes of water escape characterize the consolidation of silt-, sand-, and gravel-sized sediments: seepage, liquefaction, and fluidization. Four main types of water escape structures form during the fluidization and liquefaction of sands: (1) soft-sediment mixing bodies, (2) soft-sediment intrusions, (3) consolidation laminations, and (4) soft-sediment folds. These structures represent both the direct rearrangement of sediment grains by escaping fluids and the deformation of hydroplastic, liquefied, or fluidized sediment in response to external stresses. Fundamental controls on sediment consolidation are exerted by the bulk sediment properties of grain size, packing, permeability, and strength, and by external disturbances which act to trigger liquefaction and fluidization. The liquefaction and fluidization of natural sands usually accompany the collapse of loosely packed cross-bedded deposits. Water escape structures most commonly form in fine- to medium-grained sands deposited at high sedimentation rates and are particularly abundant in cross-laminated deposits. Their development is favored by upward decreasing permeability within sedimentary units. They are especially common in sequences made of alternating fine- and coarse-grained units such as deep-sea flysch, prodelta, and, to a lesser extent, fluvial point bar, levee, and proximal overbank deposits. Descriptors: *Geothermal studies, *Geochemistry, Water chemistry, Thermal water, Leaching, Water sources.

The application of geochemistry to geothermal energy resources requires an understanding of the sources of fluid constituents and a recognition of the major types of geothermal systems. For geochemical and most other purposes, the fundamental basis for classifying these systems is the physical state of the continuous fluid phase, whether liquid or vapor. The two contrasting types are called hot-water and vapor-dominated. The geochemical behavior of substances of high and low volatility obviously must differ greatly, depending on the physical state of the dominant fluid. Many constituents are useful in evaluating the hot-water systems, but only a few volatile constituents are significant to the vapor-dominated systems. The water that recharges most geothermal systems is, in overwhelming proportions, the local dominant meteoric water of each area. The chemical composition of thermal waters may be dominated by water-rock reactions, or constituents already dissolved in water of any type may be added to a system of convecting meteoric water. Concentrations of the major rock-forming elements in waters are controlled largely by temperature-dependent reactions. (Knapp-USGS)

**QUATERNARY SEDIMENTATION ON THE AMAZON CONTINENTAL MARGIN: A MODEL,**
Woods Hole Oceanographic Institution, Mass.
J. D. Milliman, C. P. Summerhayes, and H. T. Barretto.
Geological Society of America Bulletin, Vol 86, No 5, p 610-614, May 1975. 5 fig, 26 ref. NSF GX-41960.

Descriptors: *Sediment transport, *Sediment distribution, *Shores, Sedimentation, Sediments, South America, Estuaries, Coastal plains, Quaternary period, Model studies, Sea level.
Identifiers: *Nearshore sedimentation, *Amazon River sediments, *Amazon River, Nearshore environment, River mouth, Deep-sea sediment.

Sedimentation on the Amazon continental margin occurred in two distinct patterns during the Quaternary Period. During interglacials, when sea level was high (as at present), most of the sediment contributed by the Amazon River was deposited near the river mouth, then transported northwest along the innnermost shelf by longshore currents. Apparently, little Amazon sediment escaped the nearshore environment. As sea level fell in response to glacial advance, the sedimentation pattern remained roughly similar, resulting in construction of an extensive prograding shoreline. Once the sea fell more than -60 to -80 m relative to present sea level, however, most Amazon sediment was channeled directly to the deep sea. Shoreline accretion stopped, but prograded sediments were preserved as a mud wedge that presently occupies the inner shelf seaward of the Amazon River. This model also explains the accumulation of large quantities of arkosic sands throughout the western Equatorial Atlantic deep sea during Pleistocene glacial epochs. These arkosic sediments appear to have been derived mostly from the Andes Mountains via the Amazon River. (Lee-ISWS)

Identifiers: *Masonboro Inlet(NC).

The Masonboro Inlet system is a complex arrangement of channels connecting the coastal waterways to the Atlantic Ocean. The flow through the system was computed by means of a numerical model based on the equations of unsteady flow which represent the laws for the conservation of mass and momentum. An implicit method was used to find the solutions for the finite difference equations. The method requires that the basic equations be satisfied at all locations simultaneously. A comparison of the computed results with the field observations demonstrated the accuracy, reliability, and efficiency of the method. It was proposed that the simulation model can handle other inlets with little difficulty, because other inlets are generally much simpler than the Masonboro Inlet. (Lee-ISWS)

C. A. Oviatt, and S. W. Nixon.
Estuarine and Coastal Marine Science, Vol 3, No 2, p 201-217, April 1975. 10 fig, 7 tab, 64 ref, 1 plate.

Descriptors: *Estuaries, *Sediments, *Rhode Island, *On-site investigations, Sediment distribution, Sampling, Equipment, Analysis, Data collections, Suspension, Deposition(Sediments), Nitrogen, Carbon, Biomass, Sedimentation rates, Silts, Organic matter, Organic compounds, Bottom sediments.
Identifiers: *Narragansett Bay(RI).

Monthly samples of sediments deposited in traps at three locations in Narragansett Bay, Rhode Island, showed a gradient in sediment activity that increased from an annual mean of 20 + or -8.8 g/sq m/day at the head of the estuary to 51 + or -16.7 g/sq m/day at the mouth. Deposited materials were significantly higher in total organic matter, organic carbon, and nitrogen than near surface sediments on the bottom. These parameters showed a gradient that decreased toward the mouth of the bay, with organic matter dropping from 14 + or -1 to 10 + or 1% of the dry weight deposited; carbon from 5.4 + or -0.9 to 3.4 + or -1.0%; and nitrogen from 0.6 + or -0.1 to 0.4 + or -0.1%. The annual mean carbon/nitrogen ratio was 8.2 in the lower bay and 8.7 in the upper bay. Deposited materials were dominated by particles in the silt size range from 4-60 micrometers and comprised for the most part resuspended bottom sediments rather than fresh inputs of material from the water column. **DEVELOPMENT OF POROUS POLYVINYL CHLORIDE COATED TUBULETS FOR SEA-WATER DESALINATION,**
DeBell and Richardson, Inc., Enfield, Conn.
B. Baum, R. A. White, and J. Lakis.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 378, $3.75 in paper copy, $2.25 in microfiche. Office of Water Research and Technology, Report OSW-RDPR-75-1006, June 1975. 42 p, 9 tab, 6 fig, 3 ref. 14-30-3250.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, Cellulose, *Permeability, Sea water.
Identifiers: *Composite membranes, Tubules, Blend membranes, Polysulfore, Acrylamide, Polyvinyl alcohol, Polyacrylic acid, *Cellulose acetate, Salt rejection, *Asymmetric membranes.

Asymmetric cellulose diacetate/triacetate membranes were cast onto 0.027 inch diameter porous polyvinyl chloride tubulets. A flux of 4 gf2d at 99% R sub s, 3.5% NaCl/1200 psi was obtained. This achieves the equivalent of 4,200 gallons per cubic foot of module per day - far in excess of commercial units. Work with NS-1 coated onto tubulets primed with acrylamide gel, asymmetric polysulfone, and asymmetric cellulose acetate was less successful. The NS-1 coating can be cured at lower temperatures by the use of triethylamine catalyst.

**SOLAR STILL WITH REPLACEABLE SOLAR ABSORBING LINER AND WEIGHT CONTROLLED FEED INLET,**
L. E. Massie.
US Patent No 3,880,719, 3 p, 6 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 933, No 5, p 2210, April 29, 1975.

Descriptors: *Patents, *Solar still, *Desalination apparatus, *Waste water treatment, *Water quality control, Solar distillation, Evaporation, Heat exchangers, Water purification, Equipment.

This invention provides a solar still with an evaporating tray that is covered, or constructed of, a black pliable material that can be easily replaced, or continuously cleaned, or renewed. The weight of the fluid in the tray, or the deflection of the tray due to the weight of the fluid operates valves controlling the fluid level. Counterweights, calibrated springs, or other counterloading mechanisms are provided that can be adjusted to calibrate the fluid level control system to accommodate variations in fluid density and rate of fluid refill. A heat exchange system is also provided to convert waste heat radiated from the evaporator tray and other sources, to heat the incoming fluid. The fluid monitoring system is used to detect the accumulation of excessive water in the evaporating tray and to vent this excess fluid without contaminating the interior of the still enclosure. To protect the integrity of the still enclosure, valving, water traps and other devices are used to prevent the entry of contaminants, insects and other foreign matters. (Sinha-OEIS)
W75-09643

**SYSTEM FOR THERMAL DESALTING OF WATER,**
I. Z. Makinsky, E. A. Kasimzade, and S. P. Baksht.
US Patent No 3,883,400, 3 p, 1 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 729, May 13, 1975.

Descriptors: *Patents, *Desalination, *Desalination apparatus, *Waste water treatment, Evaporators, Heat exchangers, Condensers, Equipment, Distillation, Demineralization.
Identifiers: *Thermal desalination.

The specific object of the invention is to develope a system for thermal desalting of water having simple construction and providing for a low cost of the desalted water due to the use of low-potential heat of exhaust steam of a turbine without reducing the turbine efficiency. The turbine condenser is connected through a pipeline in series with an evaporator and a water-to-water heat exchanger for forming a recirculation water cooling system. The system comprises in combination: feeding and return headers for distributing cooling water in pipelines of the system; at least one steam turbine having an exhaust; condenser means connected to the exhaust through a pipeline; an adiabatic evaporator having an inlet side and a first and second outlet side, having its inlet side connected to the condenser through a pipeline; water-to-water heat exchanger having a first, second and separate third side, the first side being connected to the first outlet side of the evaporator, the second side being connected to the condenser, the third side being connected to the feeding and return header means for distributing cooling water so that fluid flowing through the heat exchanger is brought to the temperature of the cooling water; and a distilling condenser connected through a pipeline to the second outlet side of the evaporator for receiving steam. (Sinha-OEIS)
W75-09653

**DESALINATION PROCESS,**
Department of the Navy, Washington, D.C. (assignee)
R. E. Jensen.
US Patent No 3,883,412, 4 p, 6 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 733, May 13, 1975.

Descriptors: *Patents, *Desalination processes, Desalination apparatus, *Waste water treatment, Sea water, Brackish water, Water purification, *Ion exchange, *Electrodes.
Identifiers: Deionization.

The apparatus and method for desalination of water consists of creating a space charge layer through the use of porous charged electrodes submerged in the saline solution and thereafter removing the water from the impurity ions. The energy used in this process can be partially recovered by replacing the electrodes in another saline solution and collecting the energy produced in the external circuit due to the diffusion of the ions collected by the electrodes in the saline solution. The ions concentrate near the electrodes after application of electrical potential reducing ion concentration in the center of the cell. Partial deionization can be accomplished by removal of water near the center of the cell without disturbing space charge layers. More complete desalination may be accomplished by treating the water in several successive cells. (Sinha-OEIS)
W75-09654

**REVERSE OSMOSIS APPARATUS,**
United Kingdom Atomic Energy Authority, London (England). (assignee)
R. Gayler.
US Patent No 3,883,434, 3 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 739, May 13, 1975.

Descriptors: *Patents, *Reverse osmosis, *Membranes, *Water quality control, Water pollution control, Equipment, *Desalination apparatus, *Waste water treatment.

The reverse osmosis apparatus comprises: a membrane assembly placed within a pressure shell; means for passing a feed solution through the assembly so as to obtain a product liquid by reverse osmosis; and assembly driving means for rotating the assembly within the shell. Rotating the membrane assembly of a single apparatus can provide a higher recovery ratio of product liquid than several such apparatus with non-rotatable assemblies, and furthermore, any tendency for salts to be deposited can be reduced while at the same time, velocities of feed solution within the apparatus can be reduced. The assembly driving means may comprise an electric motor and gear unit, or may comprise a fluid turbine. The feed-solution or the liquid rejected by the apparatus may be used as a working fluid to drive the turbine. The apparatus may be provided with a plurality of membrane assemblies and assembly driving means for rotating them about a single axis. (Sinha-OEIS)
W75-09661

**MULTI-EFFECT FLASH EVAPORATOR,**
J. E. Pottharst, Jr.
US Patent No 3,884,767, 4 p, 3 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 934, No 3, p 1173, May 20, 1975.

Descriptors: *Patents, *Desalination, *Waste water treatment, *Desalination apparatus, Evaporators, Distillation, Multi-stage flash distillation, Sea water.

A multi-effect flash evaporator is provided wherein preheated seawater is passed into a header extending at least partially across a vessel or compartment into which the preheated feed water is to be discharged for flashing. The header has a number of restricted discharge means such as orifices, pipe nipples, and the like, distributed along its length for discharge of the preheated seawater upwardly. A flash chamber is places along

and generally above the discharge means and has downward extending sidewalls on both sides of the header to form flow passages. The flash chamber is placed at a level below that of the mist eliminator so that steam flowing down through the passages must substantially change its flow direction in order to pass upward to the mist eliminator. **ARIZONA AND TOMORROW'S SOLAR POWERPLANTS,**
Arizona State Fuel and Energy Office, Phoenix.
J. Martin, and D. Halacy.
(1975). 29 p, 15 fig.

Descriptors: *Powerplants, *Project planning, *Energy conversion, *Solar radiation, *Arizona, Desalination processes, Solar distillation.
Identifiers: *Solar energy.

Reasons are presented in support of the selection of Arizona as a site for a Solar Energy Research Institute and for building of prototype and functional large-scale powerplants as authorized under or implicit in Public Law 93-473. The State's climate, with an average of some 4,000 hours of sunshine yearly, an environment that would permit large equipment to remain in the open for long periods of time without damage, plenty of available land suitable for all aspects of solar energy development, and Arizona's long record of research by some of the world's outstanding authorities in the field are described as the rationale for its selection. Drawings of such devices as solar towers and solar farms are included. As background for the arguments in favor of Arizona, the report also cites work on large solar desalination plants at the University of Arizona. (McLachlan-Arizona)

**DEVELOPMENT AND SCOPE OF DRIP AND SUBSURFACE IRRIGATION,**
Udaipur Univ. (India).
M. T. Deshmukh.
In: Proceedings of the Second International Drip Irrigation Congress, p 52-57, (1974). 31 ref.

Descriptors: Agriculture, Irrigation, Subsurface irrigation, Salinity, Saline water.
Identifiers: *Trickle irrigation, *Drip irrigation.

Drip irrigation is quite suitable for arid and semi-arid regions characterized by poor saline soil, saline irrigation water, and high evapotranspiration rates. In this method, water is applied slowly and continuously to the crops on the ground surface with the help of pipes having perforations or emitters fixed at suitable intervals along the length of the pipe. Developments in the drip method of irrigation are reviewed. (See also W75-09423) (Skogerboe-Colorado State)
W75-09431

**STRIP CULTIVATION OF THE AREA WETTED BY DRIP IRRIGATION IN THE ARAVA DESERT,**
Hebrew Univ., Rehovth (Israel).
S. D. Goldberg, and M. Uzrad.
In: Proceedings of the Second International Drip Irrigation Congress, p 142-147, (1974).

Descriptors: *Strip cropping, *Saline water, *Salinity, *Sprinkler irrigation, Melons, Irrigation practices, Irrigation, Agriculture, Corn(Field).
Identifiers: *Trickle irrigation, *Drip irrigation, *Israel(Arava Desert).

Drip irrigation cultivation is in effect strip cultivation and represents almost the most intensive form of cultivation. Throughout the growing season the cultivated strip gets a more intensive set of treatments. Under arid climatic conditions in light soils and with saline water (like in the Arava), these strips will undergo considerable chemical and physical changes with would materially differ from the intermediary uncultivated strips. The problem posed was whether the cultivated strips were better, worse, or of no difference compared to the uncultivated strips. Results show that the cultivated strips were superior to the uncultivated strips. (See also W75-09423) (Skogerboe-Colorado State)
W75-09445

**MOISTURE PROFILES AND SALINIZATION OF SOILS UNDER DRIP IRRIGATION IN THE REPUBLIC OF SOUTH AFRICA,**
South Africa Dept. of Agricultural Technical Services, Pretoria.
A. Streutker.
In: Proceedings of the Second International Drip Irrigation Congress, p 258-263, (1974). 4 tab.

Descriptors: *Saline soils, Moisture content, *Crop production, Flow rates, Cotton, Potatoes, Tomatoes, Irrigation practices, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Moisture profiles, *South Africa.

Soil moisture profiles, salinization of soils, water use, and production of cotton, potatoes and tomatoes are measured on experimental plots on four soils, from sand to clay, with three different dripper spacings, and three different drip intensities. Simultaneously, soil moisture profiles and salinization are measured on different soils under citrus-trees, peach-trees and vineyards with commercial drip irrigation systems under different climates. (See also W75-09423) (Skogerboe-Colorado State)
W75-09464

**SALINITY SENSOR CONTROL OF DRIP IRRIGATION WATER APPLICATION,**
Agricultural Research Service, Brawley, Calif.
L. S. Willardson, and J. D. Oster.
In: Proceedings of the Second International Drip Irrigation Congress, p 335-340, (1974). 3 fig, 1 tab, 1 ref.

Descriptors: Salinity, *Saline soils, Crop response, Irrigation practices, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Salinity sensors, *Milo.

In-situ salinity sensors were used to control water application by drip irrigation to maintain a constant soil salinity. Milo was grown on small field plots instrumented with salinity sensors to evaluate the effect of depth of placement and initial soil salinity on plant growth and water control. Water application was fully controlled by the sensors. Response time was short enough to encourage practical use. (See also W75-09423) (Skogerboe-Colorado State)
W75-09477

**SOIL SALINITY DISTRIBUTION IN DRIP AND SUBSURFACE IRRIGATED SUMMER SQUASH,**
Agricultural Research Service, Riverside, Calif.
K. R. Davis, and W. F. Spencer.
In: Proceedings of the Second International Drip Irrigation Congress, p 358-363, (1974). 3 fig, 2 tab, 4 ref.

Descriptors: *Salinity, *Subsurface irrigation, *Irrigation practices, *Soil water movement, Management, Agriculture, Irrigation.
Identifiers: *Trickle irrigation, *Drip irrigation, *Squash.

Salt and water distribution patterns were determined around a porous tubing as part of a study to evaluate several drip and subsurface irrigation lines at Riverside, California. Generalized plot sampling after seasonal rainfall established initial soil salinity and water levels. A detailed scheme was employed for mid-season and end-season soil sampling. Soil salinity and water distributions before, during, and after the 1973 growing season of zucchini squash are discussed. (See also W75-09423) (Skogerboe-Colorado State)

**AFFORESTATION WITH SALINE WATER IN ABU DHABI,**
Ministry of Agriculture, Abu Dhabi (United Arab Emirates).
S. Tahnoon, and F. K. Aljibury.
In: Proceedings of the Second International Drip Irrigation Congress, p 370-371, (1974).

Descriptors: *Forestry, *Saline water, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Abu Dhabi.

The government of the country of Abu Dhabi is trying to make the desert bloom under adverse soil, wind, and water conditions. At present, three drip irrigation projects are underway. (See also W75-09423) (Skogerboe-Colorado State)
W75-09483

**SALINITY MANAGEMENT FOR HIGH FREQUENCY IRRIGATION,**
Agricultural Research Service, Riverside, Calif.
G. J. Hoffman, S. L. Rawlins, J. D. Oster, and S. D. Merrill.
In: Proceedings of the Second International Drip Irrigation Congress, p 372-375, (1974). 4 fig.

Descriptors: *Salinity, *Saline soils, *Saline water, *Leaching, Grain sorghum, Lettuce, Wheat, Crop response, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, High frequency irrigation.

A field plot experiment designed to determine the minimum leaching required to maintain crop yields under high frequency irrigation is described. Two varieties of wheat, grain sorghum, and lettuce are being grown in rotation each year in six replicated leaching fraction treatments. Precise measurements of the volume and salt concentration of the irrigation and drainage waters along the in situ soil salinity measurements and crop yield are reported. **AUSTRALIAN VINEYARD USES SEWAGE EFFLUENT WITH TRICKLE IRRIGATION,**
Kinnaird, Hill, deRohan and Young Ltd., Kensington and Norwood (Australia).
A. L. Read, M. F. Pietsch, and W. E. Matheson.
In: Proceedings of the Second International Drip Irrigation Congress, p 382-387, (1974).

Descriptors: Effluents, *Sewage, *Sewage disposal, *Sewage effluents, Vine crops, Irrigation, Irrigation systems, Irrigation practices, Agriculture, Clogging.
Identifiers: *Trickle irrigation, *Drip irrigation, *Grapes.

The Angle Vale Vineyard is located 32 kilometres north of Adelaide, South Australia. Supplementary irrigation is necessary for the growth of vines in the area. In 1970, Government legislation precluded the future use of water in the area, and a decision was made to use sewage effluent from Adelaide which was the only supplementary irrigation available. The 40 hectare vineyard had trickle irrigation installed and has since been enlarged to 180 hectares. The effluent has a T.D.S. varying from 1,300 to 1,800 mg/l and a varying but high algal content. The paper describes the problems of filtration and growths within the pipelines and how these problems were overcome. Monitoring of soil conditions has been necessary to study the changes in soil salinity. Maximum salinities have occurred at the perimeter of the wetted zone, approximately 50 cms from the vine rows. Total soluble salts have increased from 0.035% in the centre of the vine rows to 0.086-0.109% at the perimeter of the wetted zones. Analyses of the vine leaves and wine made from the first vintage are also reported. (See also W75-09423) (Skogerboe-Colorado State)
W75-09486

**EFFECTS OF LOCALIZED PHOSPHATE TREATMENTS AND SOLUTION PH ON THE GROWTH AND FUNCTION OF APPLE ROOTS,**
Victoria Dept. of Agriculture, Ferntree Gully (Australia). Scoresby Horticultural Research Station.
B. K. Taylor, and F. G. Goubran.
In: Proceedings of the Second International Drip Irrigation Congress, p 395-399, (1974). 4 tab.

Descriptors: *Phosphates, *Crop response, *Apples, *Root development, Nutrients, Irrigation systems, Irrigation, Agriculture, Hydrogen ion concentration, Growth rates.
Identifiers: *Trickle irrigation, *Drip irrigation.

Following the introduction of trickle irrigation to orchards, interest has risen in the possibility of feeding nutrients into such systems on a regular basis. Use of phosphatic fertilizer in this way, however, could pose a problem in that a highly localized source of P would be available to only a small portion of the root system of the tree. Movement of P away from the trickle outlet would be restricted in most orchard soils by fixation processes. The influence of localized applications of phosphate on the growth and function of apple roots at two pH levels is reported. (See also W75-09423) (Skogerboe-Colorado State)
W75-09488

**DRIP IRRIGATION EXPERIMENT ON AVOCADOS,**
California Univ., San Diego, La Jolla.
C. D. Gustafson, A. W. Marsh, R. L. Branson, and S. Davis.
In: Proceedings of the Second International Drip Irrigation Congress, p 443-445, (1974).

Descriptors: *Crop response, *Crop productivity, *Salinity, Sprinkler irrigation, Cost comparisons, Diseases, Irrigation, Agriculture.
Identifiers: *Avocados, *Trickle irrigation, *Drip irrigation.

In June, 1970 an irrigation project was initiated to compare drip irrigation with the conventional spitter-sprinkler system, commonly used in avocado orchards. Evaluation of the two methods include: (1) a comparison of growth and productivity; (2) salinity accumulation and distribution in soils under each system; (3) annual costs to operate each system; (4) determine if trees are more or less susceptible to the avocado root rot disease; and (5) observe operation of equipment. **FOR IMPROVING WATER PENETRATION INTO SOME ARIZONA SOILS-SULFURIC ACID,**
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
S. Miyamoto, and J. L. Stroehlein.
Progressive Agriculture in Arizona, Vol 27, No 2, p 13-16, March-April, 1975. Published by College of Agriculture, University of Arizona, Tucson. 1 fig, 4 tab, 2 ref.

Descriptors: *Soil management, *Arid lands, *Irrigation, *Sulfur compounds, *Penetration, Sulfur, Acidity, *Arizona, Permeability, Soil amendments, Flocculation, Salinity, Saline soils, Water quality, Soil chemical properties.
Identifiers: *Sulfuric acid.

Sulfuric acid, a waste product of the copper industry, is useful in improving water penetration into some Arizona soils. The effectiveness of sulfuric acid treatments depends not only upon the concentration of sodium and calcium in soils and water, but also upon the types of soils and the rates and methods of acid application. The effectiveness of acid treatment in increasing the rate of water penetration is discussed for soils and irrigation waters commonly found in southern Arizona. Because of soil variability and diverse irrigation practices, the amount of acid applied is site specific and caution must be exercised. The quality of irrigation water is another key variable. Five steps for field application of sulfuric acid are given. (Bowden-Arizona)

**MIX GYPSUM IN SHALLOW DEPTHS--IN SALINE SOILS,**
Central Soil Salinity Research Inst., Karnal (India).
B. K. Khosla, K. S. Dargan, and I. P. Abrol.
Indian Farming, Vol 23, No 1, p 35, April 1973. 1 fig.

Descriptors: *Gypsum, *Wheat, *Barley, *Soil surfaces, *Crop production, *Saline soils, Soil profiles, Fertilizers, Sodium.
Identifiers: *Paddy, *India.

In saline sodic soils, highest yields of paddy and wheat were obtained when gypsum was added to the upper 10 cm of the soil surface. Yields decreased when gypsum was mixed at levels 20 cm and 30 cm below the surface. The yield of paddy was 70.21 quintals per hectare when gypsum was mixed in at the 10 cm depth, and was reduced to 60.52 and 65.44 quintals per hectare when gypsum was added to the 20 and 30 cm depths respectively. In the case of wheat, 32.80 quintals per hectare were obtained when gypsum was mixed at the 10 cm level, and yields of 31.57 and 20 quintals per hectare were gathered with gypsum mixed at the 20 and 30 cm depths. It is suggested that gypsum be mixed in the surface 10 cm of soil for shallow rooted crops like paddy, wheat, and barley to obtain the highest possible yields. (Mastic-Arizona)

**IN SALT-AFFECTED SOILS MULCHING AIDS IN CROP GROWTH,**
Central Soil Salinity Research Inst., Karnal (India).
I. P. Abrol, and O. P. Dhankhar.
Indian Farming, Vol 23, No 1, p 26-28, April 1973. 3 fig.

Descriptors: *Mulching, *Saline soils, *Evaporation, *Leaching, *Irrigation, Gypsum, Soil surfaces, Calcium, Sodium, *Crop production, Fertilization, Soil profiles, Salts.
Identifiers: *Rice husks, *India.

Mulching can increase crop yields as much as 100 percent in salt-affected areas by preventing upward movement of salts from the lower soil layers. Because rice husks are not only a common waste product, but also difficult to dispose of, they were tested to determine their effectiveness as a mulch for preventing salt movement in a highly saline-sodic soil. Data on soil moisture and distribution of salts in the soil profile were collected to observe salt movement in different layers. Fertilizers were applied and usual irrigation and other cultural practices were followed during the crop season. A high yield of paddy was obtained from gypsum treated plots. In addition yields increased with increasing depths of rice husk mulch for both the gypsum treated and the untreated plots. The mulch prevented upward movement of salts by checking evaporation at the soil surface, and also kept the soil wet and solubilized some of the native calcium sources for use by the crops. (Mastic-Arizona)

## 3E. Conservation In Industry

**CLOSING UP A FINE GRADE PAPER MACHINE SYSTEM,**
MacMillan Bloedel Ltd., New Westminster (British Columbia).
J. G. Bayda.
Preprint, Canadian Pulp and Paper Association, Annual Meeting (Montreal), 1975, p 53-55B, 3 fig.

Descriptors: *Pulp wastes, *Water reuse, *Water conservation, Industrial wastes, Water pollution sources, Pulp and paper industry, Suspended solids, Recycling, Water treatment, Filtration, Water pollution control, Biochemical oxygen demand, Canada, Closed conduit flow.
Identifiers: Savealls, White water, Paper machines.

Island Paper Mills, a division of MacMillan Bloedel Ltd. in Vancouver, is an integrated paper mill producing fine papers in basis weights of 23 to 150 lb/3000 sq ft. The effluent quality leaving the process was upgraded by internal reclaim and recycle of suspended solids from various streams including press tray water and wire return roll shower water. To handle the excess volume of water containing fibers and fillers, a rich/lean white water system was designed. The seal pit is divided into two sections, one containing rich white water and the other containing dirtier streams. Contents of the latter side of the pit are sent to the saveall, and reclaimed solids are returned to the pulper. The saveall-clarified water is used for low-level makeup to the seal pit and the rich white water tank, with excess going to the sewer. As a result of closing the system, suspended solids load and BOD in the process effluent are below 15 lb/ton and effluent volume is about 7000 imperial gal/ton. Machine runnability has been maintained, and paper quality problems relating to the closed system have not been encountered. (Sykes-IPC)

J. Vilars.
Papier, Carton et Cellulose, Vol 23, No 5, p 72-77; No 7, p 36-39, May, July, 1974. 7 fig, 4 tab.

Descriptors: *Water circulation, *Water conservation, *Recirculated water, *Industrial water, Mathematical studies, Water pollution sources, Freshwater, Waste water treatment, Flotation, Sedimentation, Filtration, Water pollution, Water pollution control, Flow, Closed conduit flow, Pulp and paper industry.
Identifiers: *Paper machines, *White water, Consistency.

Primary paper machine water circulation systems are examined in detail, particularly with respect to formulas and calculations relating to flow, consistency, and recirculation in systems with combined treatment of all white waters, in systems with addition of fresh water, in systems with separation of table-roll (or hydrofoil) white water and suction-box white water, in systems with separate treatment of white waters with addition of clear water to the suction-box white water, and in systems with separate treatment of white waters with addition of fresh water ahead of the headbox or in the table-roll circuit. The desirability of separate treatment of white waters, maintaining minimum white water consistency, and avoiding the introduction of fresh water is pointed out. Secondary water-circulation systems are also examined, including the need for using a minimum amount of fresh water, the principles of sedimentation, flotation, and filtration clarifiers used in fiber and filler recovery, the supply of paper-machine showers, and the paper-machine stock supply system. **AN INVESTIGATION OF FACTORS AFFECTING THE INTENSITY OF WATER USE IN THE LAJAS VALLEY IRRIGATION PROJECT,**
Puerto Rico Univ., Mayaguez. Dept. of Agricultural Economics.
P. I. A. Cordero.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 381, $4.25 in paper copy, $2.25 in microfiche. Puerto Rico Water Resources Research Institute, Mayaguez, Completion Report, September 1974. 61 p, 9 fig, 24 tab, 26 ref. OWRT A-036-PR(1).

Descriptors: Farms, Irrigation, Topography, *Water utilization, *Irrigation structures, *Drainage structures, Water supply, Costs, *Puerto Rico, *Irrigation water, Rainfall intensity.
Identifiers: *Lajas Valley(P.R.), *Rainfall frequency.

Effects of a group of socio-economic factors on the intensity of irrigation water use in Lajas Valley, Puerto Rico were investigated. The factors were: size of farms, ownership of farms, available labor for the operation of irrigation systems, costs

of irrigation, employment of farmers in non-agricultural activities, administration of irrigation services, topography of the farms, and soil permeability. The following had a direct significant relationship with the intensity of irrigation water use in available labor for the operation of irrigation systems, irrigation costs, topography, and soil permeability. The other factors studied did not present a significant relationship. The data obtained are of paramount importance for government agencies that are involved in the development of the Lajas Valley Irrigation Project and similar irrigation systems in Puerto Rico.

**DRIP IRRIGATION-WORLDWIDE,**
California Univ., San Diego, La Jolla.
C. D. Gustafson, A. W. Marsh, R. L. Branson, and S. Davis.
In: Proceedings of the Second International Drip Irrigation Congress, p 17-22, (1974). 1 fig.

Descriptors: *History, *Irrigation practices, Irrigation systems.
Identifiers: *Trickle irrigation, *Drip irrigation.

Good water supplies are always in demand. All around the world, problems with water are: short supply, poor quality and/or expensive. In reviewing the development of drip irrigation, it is apparent that the greatest interest is in areas where there is a problem with water supplies. Poor soils or steep terrain also encourages the use of drip irrigation. Drip irrigation has been used for years. What is new, however, is its application to modern agriculture. On a commercial scale in the United States, it can be traced to 1969-70. That was not the beginning, however, since many industries have been using some type of drip irrigation for a long time. Drip irrigation had its beginning in the greenhouse culture after World War II in the United Kingdom. (See also W75-09423) (Skogerboe-Colorado State)
W75-09424

**THE PROGRESS AND PROBLEMS OF DRIP IRRIGATION IN ISRAEL,**
Hebrew Univ., Rehovoth (Israel).
E. Rawitz, and D. Hillel.
In: Proceedings of the Second International Drip Irrigation Congress, p 23-28, (1974). 18 ref.

Descriptors: Crop response, Design criteria, History, Irrigation, Irrigation system, *Irrigation practices, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Israel.

The 'state of the art' of drip irrigation in Israel is reviewed regarding both equipment and operational practices. Available equipment is generally reliable in conforms to manufacturer's specifications of hydraulic properties. Filtering and clogging of small discharge orifices remains a problem under certain conditions. A standard head has been developed for connection to the main system incorporating filter, vacuum breaker, fertilizer applicator, pressure regulator, and automatic valves. Hydraulically or electrically actuated automatic valves are used either singly or for sequential operation. Many growers have reported excellent results with drip irrigation of orchards, truck crops, and flowers. The relative advantages of drip irrigation are especially pronounced where relatively saline water must be used under extremely arid conditions. Criteria and recommendations have yet to be determined regarding irrigation frequency and application amounts in relation to emitter spacing and discharge, and percent of wetted area for different crops, soil profile characteristics, climatic conditions, and water quality. Some consequences of improper operation may be under-irrigation, excessive restriction of the root zone, and excessive leaching of water and nutrients below the rooting depth. (See also W75-09423) (Skogerboe-Colorado State)

**DRIP IRRIGATION DESIGN CRITERIA FOR TREE CROPS IN FLORIDA AND OTHER HUMID REGIONS,**
Florida Univ., Gainesville.
D. S. Harrison, and J. M. Myers.
In: Proceedings of the Second International Drip Irrigation Congress, p 33-37, (1974). 11 ref.

Descriptors: *Orchards, *Crop response, *Florida, *Humid area, Irrigation practices, Citrus fruits, Irrigation, Agriculture, Irrigation systems, Irrigation design.
Identifiers: *Drip irrigation, *Trickle irrigation.

Drip irrigation has been installed on approximately 4,000 acres of citrus and other orchard crops in Florida during the past 2 years. Some of the reasons for increased interest in this method of irrigation are: (1) conservation of water, (2) labor savings, (3) lower operating costs, and (4) lower power requirements. Some problems have developed and the future of drip irrigation in Florida will depend on how those problems are dealt with. Among significant problems are: (1) improper water filtration, (2) research data on crop response not readily available, (3) vandalism, (4) unavailability of fully tested design criteria, (5) emitter spacing, and (6) expected life. Two years research data in Florida on strawberries, and one year on tomatoes show that response to drip irrigation is comparable to other application methods and water savings as much as 60-70% may be expected. Fertilizer response, when applied through the drip system, has been outstanding. (See also W75-09423) (Skogerboe-Colorado State)

**DRIP IRRIGATION RESEARCH IN OREGON - A PROGRESS REPORT,**
Oregon State Univ., Corvallis.
M. N. Shearer, L. W. Martin, P. B. Lombard, and W. M. Mellenthin.
In: Proceedings of the Second International Drip Irrigation Congress, p 38-43, (1974). 4 fig, 3 tab.

Descriptors: Crop response, *Crop production, Sugarcane, *Oregon, Irrigation system, Irrigation, Agriculture, *Sprinkler irrigation, Filtration.
Identifiers: *Trickle irrigation, *Drip irrigation, Pears.

Drip irrigation research was initiated in Oregon in 1973. One year's results are reported on the following: (1) total yield, fruit size, and water requirements, of cane fruit under drip and sprinkler irrigation, (2) total yield, fruit size, and water requirements of pears grown on low intake rate montmorillonite soils under drip and rill irrigation, (3) evaporation pan coefficients for scheduling drip irrigation, and (4) filtering requirements for irrigation water containing glacial silt and debris. **DRIP IRRIGATION ON CITRUS,**
Zebediela Estates (South Africa).
D. H. Bester, D. C. Lotter, and G. H. Veldman.
In: Proceedings of the Second International Drip Irrigation Congress, p 58-64, (1974). 2 fig, 1 tab.

Descriptors: *Evaporation pans, Irrigation, Agriculture, Sprinkler irrigation, Wetting, Fertilization, Filtration, Orchards, *Citrus fruits.
Identifiers: *Trickle irrigation, *Drip irrigation, South Africa.

A study was conducted on citrus to establish the comparative efficiency of drip irrigation, dragline sprinkler irrigation, and a hose system discharging water directly into irrigation basins in South Africa. The following aspects of drip irrigation were investigated: (1) Soil moisture determinations and wetting patterns, (2) the possibility of using an evaporation pan to determine irrigation requirements, (3) the effect of different numbers of spacing of drippers per tree, (4) the effect of different dripper discharge rates, (5) practicability of using microtubes as drippers, (6) the possibility of applying fertilizers through a drip irrigation network, and (7) factors affecting the distribution efficiency of a drip irrigation system. **SOME RESULTS OF A FIELD SURVEY OF DRIP IRRIGATION SYSTEMS IN THE REPUBLIC OF SOUTH AFRICA,**
South Africa Dept. of Agricultural Technical Services, Pretoria.
W. J. Uys.
In: Proceedings of the Second International Drip Irrigation Congress, p 65-70, July 1974. 4 tab.

Descriptors: *Clogging, Flow rates, *Surveys, Irrigation, Irrigation systems, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *South Africa.

An extensive survey was conducted in the Republic of South Africa to evaluate existing drip irrigation systems under a variety of climatic, soil, crop and management conditions. The purpose of the survey is to evaluate these systems under practical farming conditions and to identify specific problems of design, operation, and management from which future extension and research programs can be formulated. **USE OF DRIP IRRIGATION IN GERMANY,**
Kassel Univ. (West Germany).
P. Wolff.
In: Proceedings of the Second International Drip Irrigation Congress, p 71-76, (1974).

Descriptors: *Sprinkler irrigation, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Germany.

Irrigation methods similar to drip irrigation have been used in Germany for many years, and more horticulturalists are changing from overhead irrigation to drip irrigation. The reasons for changing irrigation methods were investigated. The horticulturalists are changing methods because of increasing labor costs and an increasing demand for high quality products. **VEGETABLE PRODUCTION AND WATER-USE EFFICIENCY AS INFLUENCED BY DRIP, SPRINKLER, SUBSURFACE, AND FURROW IRRIGATION METHODS,**
New Mexico State Univ., University Park.
E. G. Hanson, and T. C. Patterson.
In: Proceedings of the Second International Drip Irrigation Congress, p 97-102, (1974).

Descriptors: *Sweet corn, Onions, *Crop response, *Irrigation practices, *Vegetable crops, Irrigation systems, *Sprinkler irrigation, *Subsurface irrigation, *Furrow irrigation, Soil moisture, Salinity, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Sweet corn and onions have been grown on replicated plots with four methods of irrigation: drip, subsurface, sprinkler, and furrow. Half of the plots have been irrigated to maintain the soil moisture tension at or below 0.20 atmospheres, and the other half at or below 0.60 atmospheres. Yield, quality, and water-use efficiency pertaining to each crop are reported for three growing seasons. Changes in soil salinity are discussed. (See also W75-09423) (Skogerboe-Colorado State)

**COMPARISON OF IRRIGATION METHODS, ROOTSTOCKS, AND FERTILIZER ELEMENTS OF VALENCIA ORANGE TREES,**
Arizona Univ., Yuma.
R. L. Roth, D. R. Rodney, and B. R. Gardner.
In: Proceedings of the Second International Drip Irrigation Congress, p 103-108, (1974).

Descriptors: *Sprinkler irrigation, *Surface irrigation, *Oranges, *Fertilization, Fertilizers, Saline water, Saline soil, Irrigation practices, Irrigation systems, Irrigation, Agriculture.
Identifiers: Irrigation method comparison, *Trickle irrigation, *Drip irrigation, Micronutrients.

A 4-hectare (10-acre) block of 'Campbell' valencia orange trees planted in May 1971, was used to compare 5 irrigation methods, 2 types of rootstocks, and a phosphate and micronutrient variable. The irrigation methods were border, full-coverage sprinklers, limited-coverage sprinklers, basin, and trickle. Maximum tree growth, as measured by increase in trunk circumference, was achieved from the trickle and basin irrigation methods, even though these methods used approximately one-twentieth the water as compared to the normal border irrigation method. The full-coverage sprinkler method restricted tree growth due to salt injury of the leaves. Nitrate and salt concentrations in the root zone were mapped for each irrigation method. No observable effects of the fertilizer variables have been detected at this time. (See also W75-09423) (Skogerboe-Colorado State)
W75-09439

**DRIP IRRIGATION: SURFACE AND SUBSURFACE COMPARED WITH SPRINKLER AND FURROW,**
Agricultural Research Service, Riverside, Calif.
S. Davis, and W. J. Pugh.
In: Proceedings of the Second International Drip Irrigation Congress, p 109-114, (1974). 3 fig, 2 tab, 2 ref.

Descriptors: *Furrow irrigation, *Sprinkler irrigation, *Subsurface irrigation, Melons, Agriculture, Irrigation.
Identifiers: *Trickle irrigation, *Drip irrigation, Squash.

Four studies are described that compared crop response to various combination of drip, subsurface, furrow and sprinkler irrigation. Study concludes that (1) when the amount of water applied is near the consumptive use requirements, subsurface irrigation has greater production and better water use efficiency, (2) less water is needed for drip and subsurface irrigation than for furrow or sprinkler irrigation, because less water is lost to direct evaporation and deep percolation, and (3) the applicators used applied water equally well to the surface or subsurface soil, except where deposits from evaporation occurred. **THE USE OF FOGGERS IN DRIP IRRIGATION,**
Perma-Rain Irrigation, Inc., Lindsay, Calif.
R. O. Schade.
In: Proceedings of the Second International Drip Irrigation Congress, p 129-130, (1974).

Descriptors: Crop response, Irrigation systems, *Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Foggers.

The rapid increase in drip irrigation in the United States has been accompanied by a large number of new products for its application. Most of this new equipment has been emitters of various types. These emitters are used to reduce the flow and to apply the water directly to the surface of the soil. In addition to emitters a device known as a fogger is also being widely used. The fogger fogs or sprays the water into the air. The droplet size and output of each fogger ranges from 2 to 5 gallons per hour which is comparable to the discharge rate of most emitters being used today. Foggers have been installed on an estimated 8,000 acres. This accounts for approximately 15% of the acreage being irrigated by drip irrigation. Foggers are being used to irrigate citrus, decidious fruit, grapes, nuts and ornamentals. The area of principal usage is the San Joaquin Valley of California. (See also W75-09423) (Skogerboe-Colorado State)

**A CONSTANT MICRO SOURCE OF MOISTURE AS A COMPONENT IN A GRADIENT SYSTEM FOR A HIGH LEVEL PRODUCTION,**
Agricultural Research and Educational Center, Bradenton, Fla.
C. M. Geraldson.
In: Proceedings of the Second International Drip Irrigation Congress, p 131-136, (1974). 4 fig, 4 ref.

Descriptors: *Nutrients, Agriculture, Irrigation, Crop production, *Moisture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Micro-pore tubing.

The objective was to evaluate the use of a constant micro source of moisture which could be used as an alternative to a constant water table in establishing nutrient gradients for optimal production. Constant moisture was supplied by drip (trickle system) or by micro pore tubing. Soluble

utrients were supplied primarily by banded placement on the soil bed surface. Relative placement of fertilizer, moisture and plants as the major variables were evaluated in conjunction with different oils as well as the sources of moisture. A consistent high level production of vegetables and lowers was attained by integrating contributing omponents such as soil, moisture, fertilizer and lants to establish the desired gradient system. he resultant effect in conjunction with synthetic ulch as a protective component minimizes or liminates these components as contributing variales. **RRIGATION FOR BENCHES,**
California Univ., Riverside.
. Furuta, S. Besemer, W. C. Jones, R. Strohman, nd T. Mock.
n: Proceedings of Second International Drip Irigation Congress, p 149-154, (1974). 4 fig.

Descriptors: *Greenhouses, Irrigation, Horticultural crops, Agriculture.
Identifiers: *Drip irrigation, *Trickle irrigation, *Bench crop production.

Experiments were conducted on the modification of existing irrigation systems and the use of drip irrigation for crops grown in benches. Where the system was properly designed, excellent plant growth and yield resulted from the use of modified nozzle irrigation systems, and from the use of drip systems, both individual emitters and tubes with small orifices. As measured by plant performance, water was more uniformly distributed in the soil where drip or the modified nozzle system was used, compared to established irrigation systems. Even with soils amended with large volumes of organic matter, uniform distribution of water occurred, even though the surface between emitters was dry. Also excellent crops were produced in a soil that would be considered too tight or heavy for use in a bench. Considerable savings in the amount of water used and a corresponding reduction of the volume of run-off resulted. (See also W75-09423) (Skogerboe-Colorado State)
W75-09446

**IRRIGATION FOR CONTAINER GROWING,**
California Univ., Riverside.
T. Furuta, R. Branson, W. C. Jones, R. Strohman, and T. Mock.
In: Proceedings of the Second International Drip Irrigation Congress, p 155-158, (1974).

Descriptors: *Nutrients, *Root development irrigation, Greenhouses, Salinity.
Identifiers: *Trickle irrigation, *Drip irrigation, *Container growing, Microtubes.

Trickle irrigation and modifications have been used for container growing, especially under greenhouse conditions, for more than a decade. Microtubing has been generally used. Difficulties with uniform wetting of the entire soil mass had been encountered. This and other problems have limited the use of trickle irrigation. With the development of emitters for containers, it became possible to study the use of drip irrigation for container growing. Experiments were conducted to study the soil mixture-fertilization-irrigation subsystem. Larger plants--tops and roots--were noted under drip irrigation. These plants had higher N content initially and lower Na and Cl content late in the experiment. Root distribution within the container was also influenced with more roots in the center of the ball. Considerably less water was used with drip irrigation than with overhead sprinkling. The method of irrigation influenced salinity, nutrient content of drainage water and the wetting pattern in the soil. (See also W75-09423) (Skogerboe-Colorado State)
W75-09447

**AUTOMATIC DRIP IRRIGATION FOR GREENHOUSE TOMATO PRODUCTION IN WEST TEXAS,**
Texas A and M Univ., Lubbock.
L. New, and R. Roberts.
In: Proceedings of the Second International Drip Irrigation Congress, p 159-164, (1974). 1 fig.

Descriptors: *Crop production, *Tomatoes, *Automatic control, *Automation, Greenhouses, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Automatic irrigation.

Soil moisture sensors are used to automatically control the operation of drip irrigation systems and maintain optimum moisture levels in West Texas tomato greenhouses. Up to ten thousand square feet of growing area is being successfully irrigated by one sensor. Time clocks cause intermittent irrigation which helps prevent overwatering, puddling and runoff. Water flow control valves limit drip emitter water application rates to 1.0 to 1.5 gallons per hour. (See also W75-09423) (Skogerboe-Colorado State)
W75-09448

**HIGH-FREQUENCY POROUS TUBE IRRIGATION FOR WATER-NUTRIENT MANAGEMENT IN HUMID REGIONS,**
Agricultural Research Service, Florence, S.C. Coastal Plains Soil and Water Conservation Research Center.
C. J. Phene.
In: Proceedings of the Second International Drip Irrigation Congress, p 166-171, (1974). 6 fig, 1 tab, 8 ref.

Descriptors: *Sweet corn, *Crop response, *Subsurface irrigation, Nitrogen, Automation, Irrigation efficiency, Nutrients, Furrow irrigation, Sprinkler irrigation, Irrigation practices, Irrigation systems.
Identifiers: *Trickle irrigation, *Drip irrigation, *Porous tube irrigation.

A plastic porous tube and an electronic soil matric potential sensor supplied sweet corn with nutrients and water automatically by controlling the water content of a limited volume of root-zone soil. Sweet corn yield and water-use efficiency obtained with high-frequency porous tube irrigation systems were compared with those obtained from high-frequency sprinkler and furrow irrigation systems under similar irrigation control and fertility. In another experiment, sweet corn yield, plant nitrogen uptake, and soil (NO3(-) movement were studied under controlled soil matric potential for various application rates of N and K. Ear yield with high-frequency porous tube irrigation was 10.5 and 12.6% greater than ear yield obtained with furrow and sprinkler irrigation, respectively. Water-use efficiency was 37 and 54% higher for sensor controlled high-frequency porous tube irrigation than for furrow and sprinkler irrigation. (See also W75-09423) (Skogerboe-Colorado State)
W75-09449

**CONTROL OF WATER BY DRIP IRRIGATION FOR ALFALFA SEED PRODUCTION,**
Agricultural Research Service, Brawley, Calif.
L. S. Willardson, R. Hageman, and A. W. Marsh.
In: Proceedings of the Second International Drip Irrigation Congress, p 172-177, (1974). 2 tab, 3 fig.

Descriptors: *Alfalfa, *Seeds, Crop response, Irrigation systems, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Drip irrigation controlled soil water tension treatments in an alfalfa seed production experiment resulted in a 4-fold yield difference between the best and poorest treatments. The experiment had 6 replications of 4 treatments and has been conducted for 2 years. Yield of forage as well as seed yields were determined. (See also W75-09423) (Skogerboe-Colorado State)

**TRAVELING TRICKLE SYSTEM,**
Agricultural Research Service, Riverside, Calif. Salinity Lab.
S. L. Rawlins, G. J. Hoffman, and S. C. Merrill.
In: Proceedings of the Second International Drip Irrigation Congress, p 184-187, (1974).

Descriptors: Irrigation design, Cost comparisons, *Cost analysis, Irrigation, Irrigation systems, *Irrigation practices, Agriculture, Sprinkler irrigation.
Identifiers: *Trickle irrigation, *Drip irrigation, *Traveling trickle systems, Row crop irrigation.

Typical drip irrigation systems deliver frequent applications of small volumes of water using a large number of small diameter orifices installed along tubes. The long lengths of tubes and large number of emitters required make drip irrigation costly for row crops. In addition, the small diameter of the orifices required to control water flow in such a system makes it susceptible to plugging and adds an additional filtration expense. A traveling trickle system is described that circumvents both of these problems by controlling water application with a few large orifices moved along the row rather than with a large number of fixed location orifices. Results are presented from cost analyses. (See also W75-09423) (Skogerboe-Colorado State)

**CHEMICAL TREATMENT OF DRIP IRRIGATION WATER,**
Hawaiian Sugar Planters Association Experiment Station, Honolulu.
B. A. McElhoe, and H. W. Hilton.
In: Proceedings of the Second International Drip Irrigation Congress, p 215-220, (1974). 2 fig, 2 tab.

Descriptors: *Microorganisms, *Bacteria, Plugging, *Orifice flow, *Orifices, Irrigation, Agriculture, Irrigation efficiency, Irrigation systems, Irrigation water.
Identifiers: *Drip irrigation, *Trickle irrigation, *Chemical treatment.

Bacteria and other microorganisms in water are contributors to orifice plugging. Their skeletons, the slimes they produce, and their metabolic products are the glue that binds fine soil particles to the walls of the tube. Chemical treatment can arrest the agglomeration process and significantly reduce plugging. (See also W75-09423) (Skogerboe-Colorado State)
W75-09457

**MOVEMENT OF WATER AND SALTS UNDER HIGH FREQUENCY IRRIGATION,**
Agricultural Research Service, Riverside, Calif. Salinity Lab.
P. A. C. Raats.
In: Proceedings of the Second International Drip Irrigation Congress, p 222-227, (1974). 5 fig, 14 ref.

Descriptors: *Soil water movement, *Salinity, *Infiltration, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *High frequency irrigation.

Many modern irrigation systems deliver water at short intervals, in space as well as in time. Theoretical analyses show that the remaining variations are damped rapidly. Consequently, steady, one-dimensional movement and uptake is used as a basis for further analysis. Qualitative features of possible steady pressure head and water content profiles are discussed. Specific calculations for various leaching fractions and amounts of capillary rise from a water table are based on empirical, but realistic models for the dependence of the hydraulic conductivity upon the pressure head and for the spatial distribution of the rate of uptake. The resulting salinity profiles are also calculated. The results are compared with earlier, more approximate calculations. (See also W75-09423) (Skogerboe-Colorado State)

**OPTIMUM LATERAL PLACEMENT FOR SUBSURFACE IRRIGATION SYSTEMS,**
Minnesota Univ., St. Paul.
J. R. Gilley, and E. R. Allred.
In: Proceedings of the Second International Drip Irrigation Congress, p 234-239, (1974). 6 ref.

Descriptors: *Subsurface irrigation, *Mathematical models, *Irrigation design, Irrigation, Irrigation efficiency, Irrigation systems, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Design of a subsurface irrigation system requires both the proper placement of the lateral line in the soil profile and proper lateral discharge. The lateral placement depends on the nature of the soil-moisture movement from the applicator and the extraction pattern of the irrigated crop. The optimum location of the laterals will therefore vary with soil type and the crop being irrigated. A mathematical model describing soil-moisture movement during subsurface irrigation has been developed. The results of the portion of the model describing infiltration from the subsurface lateral compare quite favorably with data available in the literature. A series of one dimensional sinks, to simulate soil-moisture extraction by plants, has been combined with the infiltration model to obtain a model of soil-moisture movement during subsurface irrigation. The model was used to determine optimum lateral placement as a function of soil type and crop root zone depth to obtain the desired crop extraction patterns. Results of the model indicate the optimum lateral placements also have higher irrigation efficiencies than other placement values. These variables were used to develop design curves relating lateral depth, spacing and discharge to soil type and crop extraction pattern. Results also indicate that for proper design, lateral depth is more important than lateral spacing. (See also W75-09423) (Skogerboe-Colorado State)

**AN EXPLANATION FOR THE GROWTH ADVANTAGE OF DRIP IRRIGATION,**
New Mexico State Univ., University Park.
R. S. Freeburg, D. J. Cotter, and N. S. Urquhart.
In: Proceedings of the Second International Drip Irrigation Congress, p 265-270, (1974). 2 fig, 3 tab, 6 ref.

Descriptors: *Diurnal, *Temperature, *Soil temperature, *Furrow irrigation, *Sweet corn, *Crop response, Agriculture, Irrigation, Irrigation practices.
Identifiers: *Drip irrigation, *Trickle irrigation.

Soil, leaf, and air temperatures were measured for sweet corn during a 16-day period following emergence. The corn was grown in an experiment designed to compare trickle (drip) irrigation to furrow irrigation. There was significant differences between the temperature regimes produced by the two irrigation methods. The effects were especially notable in the soil temperatures. Based on a soil temperature of 80F which research literature indicates to be optimum for corn growth, an integrated deviation from optimum was computed for each irrigation method. Deviations above the optimum at the two-inch depth were only 785 degree-hours for the trickle system as compared to 1238 degree-hours for the furrow system during the 16-day period. During this period, the growth rate of the crop under furrow irrigation was 84 percent of that under the trickle irrigation. (See also W75-09423) (Skogerboe-Colorado State)

**TRICKLE IRRIGATION IN MICHIGAN ORCHARDS,**
Michigan State Univ., Lansing.
C. D. Kesner, and A. L. Kenworthy.
In: Proceedings of the Second International Drip Irrigation Congress, p 272-274, (1974).

Descriptors: *Irrigation practices, Irrigation systems, *Michigan, Orchards.
Identifiers: *Trickle irrigation, *Drip irrigation, Microtubes.

The concept of trickle irrigation is being rapidly accepted by Michigan fruit growers. A major source of water is from small existing wells previously used for cooling sour (red tart) cherries at harvest time and other purposes. Lakes, ponds, rivers and creeks also serve as water sources. Pressure regulators or gate valves were originally used to control in-line pressure but the present trend is toward flow regulating valves in each row lateral. The primary emitter system in Michigan is the microtube with .025, .035, .036, or .045 inch I.D. tubes being the most popular. An illustrated presentation demonstrates the techniques used in many different installations. (See also W75-09423) (Skogerboe-Colorado State)

**DRIPPER FLOW CONSISTENCY,**
Agricultural Research Service, Riverside, Calif.
S. Davis, and W. J. Pugh.
In: Proceedings of the Second International Drip Irrigation Congress, p 281-283, (1974). 6 fig.

Descriptors: *Flow characteristics, *Flow rates, *Application equipment, Equipment, Agriculture, Irrigation.
Identifiers: *Trickle irrigation, *Drip irrigation.

Several different emitters have been checked for flow consistency volumetrically, both in time for the same emitter and for several emitters along the applicator line. Results of two years' study show many of the applicators vary more than plus or minus 5% from the average. With the exception of a few drippers that were partially clogged or improperly manufactured, most of the drippers provided consistent water distribution both along the line and with time. **DESIGNING TRICKLE IRRIGATION LATERALS FOR UNIFORMITY,**
Texas A and M Univ., College Station.
T. A. Howell, and E. A. Hiler.
In: Proceedings of the Second International Drip Irrigation Congress, p 299-304, (1974). 3 fig, 6 ref.

Descriptors: *Uniformity coefficient, *Uniform flow, *Irrigation design, Irrigation systems, Design criteria, Design flow, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Proper design of trickle irrigation laterals for desired uniformity is important to prevent under-irrigation, with resulting crop damage, or over-irrigation, with resulting water losses of drainage and runoff. Recently several papers have presented trickle irrigation design data and methods; yet a simple design equation for directly determining maximum lateral lengths for different lateral slopes, trickle emitter types, pipe sizes, and desired uniformity is not available. Design equations, based on standard principles, fluid mechanics, and graphs are presented which can be used to determine maximum trickle irrigation lateral lengths for selected uniformities. The maximum lateral length for a given uniformity is given as a power function (linear log-log) of either emitter spacing or number of emitters per lateral. Engineering design applications for this method are given in the form of specific examples. Implications and assumptions inherent in the method are discussed. **PLANT WATER REQUIREMENTS AS RELATED TO TRICKLE IRRIGATION,**
E. R. Hoare, K. V. Garzoli, and J. Blackwell.
In: Proceedings of the Second International Drip Irrigation Congress, p 323-328, (1974). 3 tab, 10 ref.

Descriptors: *Water requirements, *Irrigation systems, Irrigation design, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Trickle irrigation differs from spray and flood irrigation in that water is supplied in small amounts at frequent intervals in order to satisfy, as closely as possible, the plants' immediate needs. This is in contrast to other forms of irrigation in which large quantities of water are supplied, following which a gradual drying of the soil takes place, and subsequent irrigation is carried out to replenish the reservoir of soil moisture. The difference in these two approaches to irrigation means that current methods of estimating the water requirements of crops requires further evaluation. Not only does the water requirement vary with different climatic conditions, age of the plants and the season, irrespective of the method of irrigation, but the use of trickle irrigation imposes a further variation due to its particular effect on the soil-plant-atmosphere complex. The water requirements of plants under trickle irrigation are examined and ways are suggested in which these may be calculated from evaporation data, soil properties and other characteristics specific to the particular crop. Reference is also made to the use of trickle irrigation in particular situations, and how the water requirements in such cases can best be satisfied. (See also W75-09423) (Skogerboe-Colorado State)

**DRIP AND FURROW IRRIGATION STUDIES ON SUGARCANE,**
Texas A and M Univ., Weslaco. Agricultural Research and Extension Center.
C. J. Gerard.
In: Proceedings of the Second International Drip Irrigation Congress, p 329-331, (1974). 3 ref.

Descriptors: *Sugarcane, *Furrow irrigation, *Crop response, *Texas, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Research was conducted to evaluate the influences of drip and furrow irrigation on growth and yield of sugarcane in 1972 and 1973 in the Lower Rio Grande Valley of Texas. Drip irrigation treatments were 0, 25, 50, 75, and 100 and 0, 50, 75, 100 and 125% pan evaporation in 1972 and 1973, respectively. Yield of sugarcane was a linear function of applied water in 1972 with yields ranging from 35 to 51 tons per acre. Drip irrigation treatments are greater than or equal to 0.5 pan evaporation maintained rapid stalk elongation in early May and June in 1972. Rapid stalk elongation in July, August and September was maintained when the water applied was greater than or equal to 0.75 pan evaporation. Soil moisture, salinity conditions and root growth as influenced by treatments, emitter sites and soil depths were evaluated. These findings and their implications are discussed. **WATER USE WITH DRIP IRRIGATION,**
California Univ., Parlier. San Joaquin Valley Agricultural Research and Extension Center.
F. K. Aljibury, A. W. Marsh, and J. Huntamer.
In: Proceedings of the Second International Drip Irrigation Congress, p 341-345, (1974).

Descriptors: *Evaporation pans, *Water requirements, Irrigation practices, Irrigation water, Irrigation system, Irrigation design, Frequency.
Identifiers: *Trickle irrigation, *Drip irrigation, San Joaquin Valley(California).

In the absence of proper equations to calculate water requirements with drip irrigation, irrigation consultants and dealers in California have used the same water use data developed for conventional irrigation systems. Since one of the primary advantages of drip irrigation is water savings, development of water budget to fit drip irrigation became necessary. To accomplish this objective, several drip irrigation studies were initiated in the San Joaquin Valley of California. These studies were conducted on farms where citrus, avocados, plums, olives, and grapes were grown. Applied water was measured using flow meters while the frequency and amount of water application was determined with tensiometers which were set to switch the water on at 30 centibars. Water evaporation from Class A pans established in large alfalfa fields was recorded regularly. A table is presented showing suggested drip water application as a function of Class A pan evaporation and percent plant coverage. (See also W75-09423) (Skogerboe-Colorado State)

**WATER USE BY DRIP AND SPRINKLE IRRIGATED AVOCADOS RELATED TO PLANT COVER, EVAPORATION AND AIR TEMPERATURE,**
California Univ., Riverside.
A. W. Marsh, C. D. Gustafson, S. Davis, R. L. Branson, and R. A. Strohman.
In: Proceedings of the Second International Drip Irrigation Congress, p 346-350, (1974). 2 tab, 5 ref.

Descriptors: *Consumptive use, *Sprinkler irrigation, *Air temperature, *Evaporation, Tensiometers, Irrigation systems, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Avocado, Plant cover, *Trickle irrigation, *Drip irrigation.

Water application to the avocados has been closely controlled by relating it to tensiometer readings. A sufficiency has been maintained while limiting excesses. In 1973, the drip irrigation applications have been automatically controlled by electrified tensiometers that provide signals for a controller. The measured applications are thought to represent the actual water requirement for each irrigation system as closely as it can be determined. The correlation of measured water use to evaporation from a class A pan is shown for each irrigation method as influenced by varying air temperature, percentages of plant cover, and period of the year. **TRICKLE IRRIGATION MANAGEMENT FOR COTTON AND CABBAGE,**
Agricultural Research Service, Phoenix, Ariz Water Conservation Lab.
D. A. Bucks, L. J. Erie, and O. F. French.
In: Proceedings of the Second International Drip Irrigation Congress, p 351-356, (1974). 5 fig, 4 ref.

Descriptors: *Cotton, *Frequency, *Consumptive use, *Water utilization, Agriculture, Irrigation, Furrow irrigation, Comparative productivity, Crop response.
Identifiers: *Trickle irrigation, *Drip irrigation, *Cabbage.

Cotton and cabbage studies were initiated to evaluate the effects on crop production of specified quantities and frequencies of water applications using trickle irrigation. Different quantities of irrigation water were applied at frequencies of 3, 6, and 12 days. Both studies were conducted on small plots of fine-textured, clay-loam soil, using a moderately saline water. Results of these studies indicate the following: (1) the amount of soil moisture needed by the cotton and cabbage plants for high production was approximately the same as the presently-accepted consumptive use; (2) increasing frequency of trickle to 3 days did not increase yields on this soil; and (3) trickle irrigation can decrease irrigation water requirements under conditions where furrow irrigation would not attain a high overall irrigation efficiency. **MONITORING SOIL SALINITY AND LEAF NUTRIENT LEVELS IN A YOUNG AVOCADO ORCHARD UNDER DRIP IRRIGATION,**
California Univ., Riverside.
R. L. Branson, C. D. Gustafson, A. W. Marsh, S. Davis, and R. A. Strohman.
In: Proceedings of the Second International Drip Irrigation Congress, p 364-367, (1974). 2 tab, 5 ref.

Descriptors: *Salinity, *Monitoring, *Orchards, *Leaching, *Nutrients, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Avocados.

Salinity control is an important part of the management program for avocado production because of this crop's low tolerance to salts. Soil salinity in the root zone of a newly planted avocado orchard was monitored for four years. The orchard, located in a semi-arid region of southern California, is irrigated with a moderately saline water from the Colorado River. Soil salinity rose to marginal levels during each irrigation season under both irrigation methods. Winter rainfall, however, leached accumulated salts from the soil each year. Distribution of the rainfall, as well as total amount, was an important factor with regard to adequacy of leaching. Leaf samples were analyzed annually to obtain information on the uptake of chloride, an ion toxic to avocado at relatively low levels. Leaf analysis data are also being used to evaluate the fertilization program. (See also W75-09423) (Skogerboe-Colorado State)

**WEED CONTROL UNDER DRIP IRRIGATION IN ORCHARD AND VINEYARD CROPS,**
A. Lange, F. Aljibury, B. Fischer, W. Humprey, and H. Otto.
In: Proceedings of the Second International Drip Irrigation Congress, p 422-424, (1974).

Descriptors: *Herbicides, Orchards, Irrigation practices, Irrigation, Agriculture, *Weed control.
Identifiers: *Trickle irrigation, *Drip irrigation, Vineyards.

Conventional herbicide applications in orchards and vineyards under drip irrigation have been somewhat unsuccessful. Annual applications of most herbicides have broken down in the moist area close to the dripper leaving a vigorous small circle of weed growth by summer. Herbicides differ in their rates of breakdown under drip irrigation when compared to furrow and sprinkler. Atrazine showed the greatest response to breakdown under continuously wet soils. Napropamide was affected least by wet soils. Trifluralin, profluralin, and norflurazon were intermediate. Numerous herbicide treatments have been evaluated under drip irrigation. The results of several of these are discussed. (See also W75-09423) (Skogerboe-Colorado State)

**EFFECTS OF NITROGEN FERTILIZER APPLICATIONS TO PART OF A ROOT SYSTEM,**
Victoria Dept. of Agriculture, Ferntree Gully (Australia).
G. J. T. Frith, and D. G. Nichols.
In: Proceedings of the Second International Drip Irrigation Congress, p 434-436, (1974). 1 tab.

Descriptors: *Nitrogen, *Fertilization, *Apples, *Root systems, Orchards, Irrigation, Agriculture, Irrigation water.
Identifiers: *Trickle irrigation, *Drip irrigation.

It is usual under trickle irrigation of mature fruit trees to have considerably less than the total root volume wetted. If satisfactory nutrition of these trees is to be achieved with fertilizer dissolved in the irrigation water, then the wetted roots must increase their efficiency of nutrient uptake in a manner similar to their increased water uptake. Trials with split root seedling apple trees grown in water culture has shown that the nitrogen uptake efficiency of roots is increased as the proportion of the root system supplied with nitrate nitrogen is decreased. The efficiency of water uptake from those parts of the root system supplied with nitrate nitrogen was also increased over the level of uptake in quarters without nutrients. (See also W75-09423) (Skogerboe-Colorado State)

**CHANGE IN ROOT DISTRIBUTION OF MATURE PEAR TREES IN RESPONSE TO TRICKLE IRRIGATION,**
Victoria Dept. of Agriculture, Ferntree Gully (Australia).
J. D. F. Black, and P. O. Mitchell.
In: Proceedings of the Second International Drip Irrigation Congress, p 437-438, (1974).

Descriptors: *Root distribution, *Root development, Irrigation, Agriculture, Orchards.
Identifiers: *Trickle irrigation, *Drip irrigation, Pears.

Work reported was designed to obtain an idea of the rate of adaption of the root distribution of pear trees grown under uniform sprinkler irrigation for 18 years and then converted to trickle irrigation for two years with one emitter per tree. Flow rate per emitter was 8 l per hour per tree. After two seasons the entire root system of 4 trees was exposed and examined for changes in response to the continuously moist but restricted wetted soil volume in the root zone. The intensity of new root growth was markedly higher inside the wetted soil volume. (See also W75-09423) (Skogerboe-Colorado State)

**TRICKLE IRRIGATION ON YOUNG PEACH TREES,**
Victoria Dept. of Agriculture, Ferntree Gully (Australia).
P. D. Mitchell, and J. D. F. Black.
In: Proceedings of the Second International Drip Irrigation Congress, p 452-455, (1974). 8 fig.

Descriptors: *Peaches, *Crop response, *Growth rates, Root distribution, Evaporation, Orchards, Irrigation systems, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Two field trails on young peach trees are described. Trial A. The effects of supplying 9, 18, 36, or 72 l of water per day to newly planted peach trees regardless of rainfall and evaporation demonstrate that these factors cannot be ignored in soils of imperfect drainage. Trees died under the highest rate, were severely damaged at the second highest rate, showed some root damage under the second lowest rate but grew better at this rate than at the lowest rate. Trial B. Growth of peach trees trickle irrigated daily or after 2.5 or 5 cm net evaporation intervals are compared. Response was less at the 5 cm interval than at the 2.5 cm or daily intervals. Root density in the wetted root zone was highest under the daily interval and least under the 5 cm interval. A significant linear relationship is established between trunk area increase and water applied per unit of trunk area per unit of evaporation. The treatment limit in this trial of 2.5 l per sq. cm. trunk area per cm evaporation is to be extended in further trials. (See also W75-09423) (Skogerboe-Colorado State)

**DRIP IRRIGATION IN CITRUS ORCHARDS,**
Ministry of Agriculture, Beisan (Israel).
E. Yagev, and Y. Choresh.
In: Proceedings of the Second International Drip Irrigation Congress, p 456-461, (1974). 2 fig, 7 tab.

Descriptors: *Oranges, *Crop response, Root development, Salinity, Saline soils, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

In a Valencia orange grove grafted onto sour orange root stock, drip irrigation treatments of one and two laterals per row of trees at semi-weekly and bi-weekly intervals was compared to the standard treatment of sprinkler irrigation. The water application to all treatments was based on identical daily rates. The factors checked were salt accumulation and moisture distribution pattern in the soil profile, root development, mineral content of leaves, weight of yield and number of fruit per tree, and fruit quality. There was no difference in yield and fruit quality between the treatments checked. The average salt accumulation in the soil was less with the drip irrigation treatments than with the sprinkler irrigation. The soil moisture tension below the drip lateral was low all the time and there is reason to believe that there is a loss of water below the root zone. There was no significant difference in root development between all the treatments. (See also W75-09423) (Skogerboe-Colorado State)
W75-09502

**AN INVESTIGATION ON THE USE OF DRIP IRRIGATION FOR THE ESTABLISHMENT OF MULTI-PURPOSE PARKS (GREEN BELTS AROUND THE CITIES) IN IRAN,**
Research Inst. of Forests and Rangelands, Tehran (Iran).
P. Mehdizadeh, and S. Tamaddoni-Jahromi.
In: Proceedings of the Second International Drip Irrigation Congress, p 462-467, (1974). 5 fig, 2 tab.

Descriptors: *Furrow irrigation, Crop response, *Parks, Irrigation, Irrigation systems, Irrigation practices, Forestry, Forests, Forest management.
Identifiers: *Trickle irrigation, *Drip irrigation, *Greenbelts, *Iran.

Paper deals with the application of a 'home-made' drip irrigation system in a multipurpose forest park near Tehran. The study was initiated as a pilot trial to determine: (1) if drip irrigation should be considered for irrigating forest species in the parks and green belts of Iran, (2) plant responses to drip irrigation of green belts, and (3) possible water savings. Although some suppression of height growth was found, seedlings remained healthy. The amount of irrigation water used was reduced by 85% as compared to the furrow irrigation system used previously. **TREE AND CROP RESPONSE TO DRIP IRRIGATION,**
Washington State Univ., Prosser.
J. E. Middleton, E. L. Proebsting, S. Roberts, and F. H. Emerson.
In: Proceedings of the Second International Drip Irrigation Congress, p 468-473, (1974). 5 fig, 3 tab, 3 ref.

Descriptors: *Orchards, *Crop response, *Fruit crops, Salinity, Irrigation system, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Prunes.

Bearing 'Early Italian' prune trees performed normally with 60 and 80 gallons per tree per day using continuous drip irrigation. With 20 and 40 gallons per tree per day the fruit was smaller, better colored and earlier with higher soluble solids. In the second year, the two lower rates greatly reduced bearing surface and yields. Leaf moisture data indicated no difference in the four quadrants of the tree when all water was applied at one point. Twelve hour daily applications were compared to continuous applications the second year. There were some soluble salts in the non-saline soil which were reduced measurably by movement away from the center of the drip area as the season progressed. Soil moisture movement was recorded. Growth response of first year apple trees to drip and sprinkler irrigation at comparative application frequencies and amounts was similar. (See also W75-09423) (Skogerboe-Colorado State)

**STAKED TOMATO DRIP IRRIGATION IN CALIFORNIA,**
California Univ., San Diego, La Jolla.
B. J. Hall.
In: Proceedings of the Second International Drip Irrigation Congress, p 480-486, (1974). 6 tab, 6 ref.

Descriptors: *Tomatoes, Furrow irrigation, Irrigation systems, Irrigation practices, Crop response, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Six staked tomato drip irrigated field trials, where properly grown, resulted in slightly higher yields and appreciable water savings, compared to furrow applications. Drip irrigation supplied water more uniformly which resulted in more even plant growth. Cultural operations can be carried out in the drip irrigated crops at any time, while close coordination of these operations is essential when using furrow or sprinkler irrigations. (See also W75-09423) (Skogerboe-Colorado State)
W75-09506

**SPRING CUCUMBER DRIP VS. FURROW IRRIGATION,**
California Univ., San Diego, La Jolla.
B. J. Hall.
In: Proceedings of the Second International Drip Irrigation Congress, p 486-490, (1974). 1 tab, 6 ref.

Descriptors: *Fertilization, *Furrow irrigation, *Crop response, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation, *Cucumbers.

Two field trials conducted on the early spring cucumbers started and grown in plastic row covers indicate that drip irrigation can successfully produce good yields. Less water can be used in producing as high or better yields with drip irrigation. Slow release fertilizer resulted in good yields, yet the plants appeared to run short during the last two or three weeks. Placing the drip line in the bottom of a 1 1/2 to 2-inch narrow furrow appeared to reduce the mature fruit pressure on the drip lines in bush culture. (See also W75-09423) (Skogerboe-Colorado State)
W75-09507

**THE IRRIGATION OF OLIVES BY DRIP AND OTHER IRRIGATION METHODS,**
Ministry of Agriculture, Beisan (Israel).
C. Dan.
In: Proceedings of the Second International Drip Irrigation Congress, p 491-496, (1974). 4 tab.

Descriptors: *Crop response, Agriculture, Irrigation.
Identifiers: *Trickle irrigation, *Drip irrigation, *Olives.

Drip irrigated young trees have higher and earlier yields before attaining full maturity, than trees irrigated by any other method. The number of emitters per tree was not found to be critical in the range of 4 to 8 emitters per tree. The yields of mature trees which were converted to trickle irrigation were generally somewhat higher than before. (See also W75-09423) (Skogerboe-Colorado State)
W75-09508

**PERFORMANCE OF PLANTS WITH DRIP IRRIGATION,**
California Univ., Parlier. San Joaquin Valley Agricultural Research and Extension Center.
E. K. Aljibury, M. Gerdts, A. Lange, J. Huntamer, and G. Leavitt.
In: Proceedings of the Second International Drip Irrigation Congress, p 497-502, (1974). 2 fig, 3 tab, 3 ref.

Descriptors: *Oranges, *Water utilization, *Crop response, Penetration, Furrow irrigation, Crop production, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Plums, *Drip irrigation, *Trickle irrigation.

Experiments were established to study the effect of drip irrigation on water use efficiency and production in oranges and to study the effect of drip and furrow irrigation on water penetration and performance of plums. Orange production records show higher production with drip irrigation which is attributed to improved water penetration. Plum production records show no significant difference in production or fruit quality, but irrigation efficiency was improved. (See also W75-09423) (Skogerboe-Colorado State)
W75-09509

**TRICKLE IRRIGATION MANAGEMENT FOR GRAPES,**
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
D. A. Bucks, L. J. Erie, F. S. Nakavama, and O. F. French.
In: Proceedings of the Second International Drip Irrigation Congress, p 503-507, (1974). 3 fig, 1 tab, 3 ref.

Descriptors: *Crop response, Agriculture, Irrigation, Consumptive use, Furrow irrigation, Frequency, Water utilization, Irrigation design, Irrigation practices, Water requirements.
Identifiers: *Trickle irrigation, *Drip irrigation, *Grapes.

A three-year field investigation is being conducted to determine irrigation management and design requirements for grape production. Trickle irrigation treatments include three irrigation quantities, based on ratios of a consumptive-use estimate; three irrigation frequencies--daily, 3-day and 6-day; and a variation of one or two trickle irrigation emitters per vine. Furrow irrigation treatments include the same three seasonal quantities used for the trickle irrigation applied in two or three furrows per vine; however, the irrigation frequency is varied, based on the consumptive use. First-year results were as follows: there was a 13 percent increase in yield for trickle irrigation with two emitters per vine over furrow irrigation; a 9 percent greater yield for two emitters over one emitter per vine; a 6 percent increase in berry size for trickle-irrigated fruit over furrow-irrigated; little difference in sugar content between irrigation treatments; and little difference in yield between trickle irrigation frequencies. **DRIP VS. FURROW IRRIGATION TRIALS FOR POTATO UNDER SUBTROPICAL CONDITIONS,**
Punjab Agricultural Univ., Ludhiana (India)
N. T. Singh, S. S. Grewal, and A. S. Josan.
In: Proceedings of the Second International Drip Irrigation Congress, p 515-520, (1974) 1 fig, 2 tab, 17 ref.

Descriptors: *Potatoes, Crop response, Soil temperature, *Subtropics, *Furrow irrigation, Irrigation systems, Irrigation practices, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

The drip method of irrigation was compared with conventional furrow irrigation in field grown spring and autumn potatoes. Treatments included irrigations at 0.25, 0.50, and 0.75 bar soil moisture tension at 10 cm depth and drip irrigation. As an average of six crops, for equal amounts of water used drip irrigation gave 60 q/ha or 31% higher yield than irrigation at 0.25 bar soil moisture tension. Irrigation at 0.50 and 0.75 bar tension yielded significantly lower than these treatments. Wetter soil moisture regimes lowered the maximum soil temperature at 10 cm depth by 1 to 3.5C thereby bringing it closer to the optimum required by the crop. Effect of soil moisture on soil temperature and soil strength was isolated using organic mulches. Soil temperature appeared to be a critical factor in improving yield and quality of potatoes. Drip irrigation promises a more suitable soil moisture and soil temperature regime for potato cultivation in the subtropics. (See also W75-09423) (Skogerboe-Colorado State)

**RESPONSE OF MATURE CITRUS TREES ON DEEP SANDY SOIL TO DRIP IRRIGATION,**
South Australia Dept. of Agriculture, Adelaide.
P. J. Cole, and M. R. Till.
In: Proceedings of the Second International Drip Irrigation Congress, p 521-526, (1974). 1 fig, 4 tab, 1 ref.

Descriptors: *Oranges, *Crop response, Agriculture, Irrigation, Management orchards, Salinity, Irrigation design, Irrigation practices, Irrigation systems.
Identifiers: *Trickle irrigation, *Drip irrigation.

A demonstration trial on mature vallencia oranges was established to provide guidelines for future drip irrigation management in Australia. The trees are on a deep sandy soil and were established and previously maintained by sprinkler irrigation. There may be up to 450 mg/l total dissolved salts in the irrigation water. Two designs of drip irrigation have been used - one with a row of drippers along the base of the trees only, and the other with a line along both the base and in midrow. There are twice the number of drippers in this latter system, each of half the flow rate of the former. A difference in the performance of trees are yielding less than sprinkler irrigated trees, with double line drip irrigation better than single line drip irrigation. Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 505, $3.75 in paper copy, $2.25 in microfiche. Completion Report, 1975. 39 p, 7 ref. OWRT A-026-NEB(3). 14-31-0001-5027.

escriptors: *Water loss, Water utilization, orghum, *Corn(Field), Biocontrol, *Stomata, arm management, *Drought tolerance, *Heat re-stance, Plant physiology.
entifiers: Plant breeding, *Biophysical control, orghum genotypes.

his project investigated the plant's part in con-olling water loss from cropping systems primari- in dryland agriculture but also with application irrigated conditions. Emphasis was placed on fferences in corn and sorghum in mechanisms in-olved in water loss and differences between rghum genotypes. Stomatal closure is a primary echanism for control of water loss. Stomatal sponse was evaluated by water vapor diffusive sistance and by microscopic observations of sto-atal imprints. Corn stomata closed sooner than ose of sorghum when water deficits occurred. A ethod of screening for desiccation and heat lerance was developed and used in selecting rghum genotypes. The test involves curring leaf scs, exposing them to controlled stress and valuating cellular membrane injury by measuring akage of electrolytes from the cells. Corn nerally was higher cellular tolerance to both heat d desiccation. Plants could be selected for heat d drought tolerance. Hybrids made from lected tolerant lines had a significantly positive rrelation between heat tolerance measured dur-g drought and high temperature stress periods d yield in 1974. Heat and desiccation were posi-vely correlated in tests with greenhouse grown ants.

n: Municipal Sludge Management, Proceedings of he National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, ennsylvania, p 107-113, 1974. 1 fig, 2 tab, 3 ref, 1 ppend.

Descriptors: *Sludge disposal, Canada, Agricul-ure, Metals, Nitrogen, Phosphorus, Waste isposal, Land use, Sewage sludge, Waste water reatment, Sludge treatment.
Identifiers: *Land application, Sanitary landfills.

The most common method of sludge disposal cur-ently utilized in Ontario, Canada is anaerobic igesting followed by dumping into sanitary land-ills or disposal onto farmers' fields. While land pplication is frequently used, it is looked upon as disposal practice rather than as a type of fertil-zer. The agricultural value of sludge is discussed, s well as possible hazards due to the leaching of eavy metals. Ontario has had a phosphorus emoval program which will seriously affect 150 of ts treatment facilities by the end of 1975. About 85 ercent of Ontario's sewage treatment plants will ractice phosphorus removal by that time. More onsideration is being given the benefit and azards involved with the sludge contained utrients, heavy metals, long chain organics, and nicroorganisms on soils, crops, groundwater, and urface waters. Guidelines have been prepared for he utilization of processed organic waste by land pplication. These assume that organic waste has een processed by anaerobic or aerobic digestion r other suitable processing at a municipal water ollution control plant and that land application is efined as utilizing the waste for agriculture, not nerely disposing of the sludge. Requirements for the site location, land characteristics, site management, waste application rates, and waste handling and spreading equipment are detailed. (See also W75-09532) (Prague-FIRL)

**IRRIGATING APPARATUS,**
H. C. Bennett.
US Patent No 3,880,189, 3 p, 4 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 933, No 5, p 2043, April 29, 1975.

Descriptors: *Patents, *Irrigation systems, *Irrigation efficiency, Irrigation operation and maintenance, *Valves, Flow control.
Identifiers: Flow control valves.

The invention relates to an irrigating system having improved flow-control valves. The irrigating system includes a large supply manifold from which a plurality of outlet pipes extend transversely at suitable intervals. A valve is located in each outlet pipe to individually control flow of water. The valve has a shaft extending through the outlet pipe with a transverse elongate handle which can be manipulated by an operator by means of a T-wrench. Consequently, the operator can walk along the manifold and individually manipulate each valve of each outlet pipe to obtain the desired flow without stooping. This not only substantially reduces the amount of time involved but also the amount of fatigue. The transverse handles are located both above and below the outlet pipes. The outlet pipes can extend from either side of the manifold with handles being above the outlet pipes and readily accessible in all instances. The valve includes a valve body of circular configuation having a resilient outer surface which enables the body to conform with and seal the transverse outlet pipe in which it is located. (Sinha-OEIS)

**DEVICE FOR DISTRIBUTING IRRIGATION WATER,**
M. L. King.
US Patent No 3,884,416, 4 p, 11 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 934, No 3, p 1064, May 20, 1975.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Application equipment, *Water distribution(Applied), Irrigation design, *Irrigation systems.
Identifiers: Water distribution patterns.

A device is provided for the distribution of irrigation water which comprises a body for the support of a vertical shaft, a sprinkler head affixed to the shaft and means for deriving rotational motion of the sprinkler head from the internal energy of the irrigation water passing through it. The sprinkler head is provided with a primary orifice and a secondary orifice, with the secondary orifice so aligned that the water-jet issuing from it intercepts the deflecting vane and initiates rotary motion of the vane-arm relative to the sprinkler head. The unbalanced torques resulting from the intermittant action of the secondary water jet on the vane and

from the elastic restraint of the vane-arm propel the sprinkler head into unidirectional rotary motion about its shaft. Water is conveyed through a hollow bore in the shaft through a port plate rigidly affixed to the base, and the port plate is provided with a central port and at least one radially offset port. By varying the size, shape, number and angular location of the orifices in the orifice plate, the irrigation pattern of the sprinkler may be adjusted to any arbitrary shape. (Sinha-OEIS)

**THE SAHELIAN DROUGHT - A DISASTER FOR LIVESTOCK POPULATIONS,**
Food and Agricultural Organization of the United Nations, Rome (Italy). Animal Production and Health Div.
R. S. Temple, and M. E. R. Thomas.
World Animal Review, No 8, p 1-7, 1973. 8 fig, 3 tab.

Descriptors: *Droughts, Damages, *Livestock, *Arid climates, *Recharge, *Aquifers, Grazing.
Identifiers: *Sahelian zone.

During late 1972 and early 1973, the Sahelian zone of Africa was suffering one of its worst droughts in memory. Reports by FAO/UNDP task forces working on the Sahelian drought situation are reviewed. As a result of the bad years, beginning in 1967, the majority of watering points used by both man and animal for drinking water have failed. These natural springs and hard-dug shallow wells depend heavily on annual recharge by rain water since they often do not penetrate deeply into the aquifer. As a result of the prolonged droughts and overgrazing, grazing areas have deteriorated, and the few seeds produced often fail to germinate for lack of moisture. Although accurate statistics were difficult to obtain, fairly extensive reductions in animal populations were estimated. Calf crops are likely to be greatly reduced in 1974 and 1975. Appraisals will be made of the expected needs of the livestock populations, and ways and means of rendering assistance to the affected areas in the Sahelian zone to avoid such disaster in the future will be investigated. Central Arid Zone Research Inst. Jodhpur (India). Dry Farming Research Main Centre.
R. P. Singh, H. S. Daulay, M. V. R. Prasad, and H. P. Singh.
Indian Farming, Vol 23, No 12, p 5-6, March, 1974.

Descriptors: *Arid lands, *Crop production, *Precipitation(Atmospheric), *Water conservation, *Soil amendments, Salinity, Fertilizers, Water harvesting, Evaporation, Mulching, Crops, Soil moisture, Moisture stress, Technology.
Identifiers: *India(Rajasthan).

An acute ecological imbalance of the components of productivity is responsible for limiting crop production in the drylands of western Rajasthan. In addition to low and erratic annual precipitation, problems include a high solar incidence, high wind velocity resulting in a high potential evapotranspiration, and sandy soils that are low in organic matter with poor moisture-holding capacities and high infiltration rates. Soils are often high in salinity and alkalinity; soil crust formation after sowing complicates the situation. A need exists for appropriate crop planning coupled with a flexible technology of moisture conservation and fertilizer use. Some practices that would improve crop production are: water harvesting to make full use of the limited precipitation, mulches to minimize evaporation losses, better choices of crops and varieties with characteristics such as drought tolerance and a suitable maturity pattern, fertilizers to increase yields and crop efficiencies, and the use of soil amendments for more efficient utilization of the limited soil moisture. **FORAGE PREFERENCES OF TRAINED MULE DEER ON THE BEAVER CREEK WATERSHEDS,**
Arizona Game and Fish Dept., Phoenix. Research Div.
D. J. Neff.
Special Report No. 4, June, 1974. 61 p, 15 fig, 4 tab, 3 append.

Descriptors: *Habitat, *Habitat improvement, *Deer, *Watershed management, *Nutrient requirements, *Arizona, Wildlife Conservation, Wildlife habitats, Diets, Foods, Forages.
Identifiers: Mule deer, *Beaver Creek watersheds(Ariz).

Deer forage preferences were studied in relation to experimental vegetation treatments in the ponderosa pine and pinyon-juniper types on the Beaver Creek Watersheds. A total of 203 plant taxa were tested in the field in the Utah juniper, alligator juniper, and ponderosa pine vegetation types. Watersheds treatments in the sample areas included juniper cabling, pushing, felling, and aerial herbicide application; ponderosa pine clear-cutting, strip-cutting, and wildlife burn. Under present conditions, with moderate cattle grazing and a low density deer herd, the Beaver Creek watershed study area offers an abundance of high quality forage. The experimental watershed treatments which have produced the best forage crops have combined thinning or clearing of overstory with soil disturbance from skidding or slash-piling machinery. The best diversity of forage plant species on Beaver Creek was provided by an interspersion of treated and untreated vegetation. Large uniform blocks of any one type of vegetation are likely to provide less attractive deer range. Present trends in Forest Service management practices appear to be in accordance with the principle of greater vegetation interspersion and diversity. Thus, watershed treatment practices are not inherently in conflict with the forage needs of deer. (Bowden-Arizona)

**FOR RAINFED AREAS-IMPROVED VELVET BEANS FOR INCREASED FORAGE PRODUCTION,**
Indian Grassland and Fodder Research Inst., Jhansi.
M. L. Magoon, A. Singh, and K. L. Mehra.
Indian Farming, Vol 23, No 12, p 23-25, March 1974. 3 fig.

Descriptors: *Arid lands, *Plant bleeding, *Soil moisture, Soil erosion, *Beans, *Water utilization, Hay, Fertility, Soil texture, Nitrogen fixation, Organic matter, Agroclimatology, Forage mixtures, Forage legumes.
Identifiers: *Velvet beans, Fodder, *India.

Velvet beans are ideally suited for dryland areas. They not only have value as fodder and to a limited extent as a vegetable, they also have the unique quality of improving soils in sandy areas. The velvet beans are able to put up vigorous growth and cover the ground completely in a short period of time, smothering weeds and conserving soil moisture. In this manner they prevent soil erosion and improve soil fertility and texture by the addition of organic matter and by fixing the free atmospheric nitrogen. Two varieties, Florida and Lyon beans, provide excellent green fodder for cattle and sheep. The dry pods and seeds are also good sources of protein and can be fed as hay or silage. Genetic information is being collected and research is being carried out to meet the increasing demand for superior varieties of Velvet beans for the different agro-climatic conditions. About 35 species are known, both annual and perennial legumes, of which 15 are present in India. (Mastic-Arizona)
W75-09796

**HIGH MILK PRODUCTION UNDER UNFAVOURABLE NATURAL CONDITIONS,**
Hebrew Univ., Jerusalem (Israel).
R. Volcani.
World Animal Review, No 8, p 28-33, 1973. 5 fig, 3 tab, 13 ref.

Descriptors: *Arid climates, *Milk, *Environmental control, *Water shortage, Nutrients, Animal physiology.
Identifiers: *Milk production, *Israel.

The arid and semiarid climate of Israel has made increases in milk production very difficult. The fertile and semifertile zones are very limited in extent, and often these areas are faced with water shortages. Water is piped from the Jordan and other smaller rivers to the Negev in order to produce food for cattle and dairy cows. Israel's Friesian dairy herd consists of about 100,000 milking cows. Milk production is about 6,600 liters per year per cow. Average production per cow is 10-20 percent higher in large herds because a more intensive feeding and management program is practiced. Producers are being urged to increase milk and beef production as a result of increased demand by a larger population at a higher standard of living. This can be accomplished by increasing the number of milking cows, by increasing the production per cow, or by increasing both simultaneously. The Ministry of Agriculture is attempting to increase productivity per cow which seems to be most economical in the long run. This may be accomplished through intensive feeding and management of the entire herd including importation of purebred bulls, large scale industrial dairies, and elimination of climatic stress on the cows by temperature and humidity control. (Mastic-Arizona)

**WATER REQUIREMENTS AND LIMITATIONS IMPOSED ON AGRICULTURAL DEVELOPMENT IN NORTHERN GHANA,**
G. Benneh.
In: Factors of Agricultural Growth in West Africa, Proceedings of an International Conference held at Legon, April, 1971, University of Ghana, Legon, Institute of Statistical, Social and Economic Research, p 71-81, (1971). 6 fig, 1 tab, 22 ref.

Descriptors: *Africa, *Demonstration farms, *Soil-water-plant relationships, Groundwater

availability, *Drought, Agriculture, Grasslands, Climatic data, Education, Dry farming, Irrigation, Sorghum, Cotton, Rice, Food and cover crops, Water yield improvement.
Identifiers: *Ghana.

The northern savannah belt of Ghana, virtually empty, under-utilized and with months of rainless weather, is regarded as the future granary of the country. Two variables stand in the way of this agricultural hope for the region; the region's farmers have primitive techniques and between November and March almost no rain falls in the area. Also, the amount of rain during the March-November rainy season varies a great deal. Soil moisture calculations indicate that northern Ghana can be broken into three different regions with potential crops being rice, yams, maize in the wettest, cotton in the part with four humid months, and millet, sorghum and groundnuts in the dryest region. Irrigation may solve some agricultural difficulties. However, no useable groundwater has been found for even small irrigation schemes. Capture of surface runoff during the rainy season by dams could lead to some medium size irrigation projects. One block of several hundred thousand acres in the Upper Volta Valley has high potential for such a project. However, a massive education of the region's farmers will be necessary to make irrigated agriculture on such a scale successful. (Bowden-Arizona)
W75-09800

**INDIA CASE STUDY ON IMPROVING PRODUCTIVITY IN LOW RAINFALL AREAS.**
Food and Agricultural Organization of the United Nations, Rome (Italy). Committee on Agriculture.
COAG/74/4, Appendix I, April, 1974. 16 p, 2 tab.

Descriptors: *Soil moisture, *Asia, *Irrigation, *Soil-water-plant relationships, *Demonstration farms, *Dry farming, Agriculture, Fertilizer, Plant breeding, Area redevelopment, Arid lands, United Nations, Crop production.
Identifiers: *India.

The low rainfall areas of India comprise 79 administrative districts, representing 34.1% of the net area of land planted. While the soils in these areas are low in organic matter, water is the major limiting factor in crop yields. Small holdings and primitive farming methods also lower yields. Surface water is negligible, and groundwater limited; large scale irrigation schemes have slight application in the future. Infiltration of water into the soil can be increased by contouring, mulching and increasing organic content of soil. Impoundment of water runoff by dams, etc, requires that farming techniques be changed to reap the full benefit of the additional soil moisture. It is essential to educate farmers to the needs and virtues of new crop varieties. Without the ready local availability of seed of suitable varieties, fertilizer, agricultural equipment, the means of acquiring them more probably on credit than for cash, and finally a marketing organization for produce, the typical farmer of such regions is unlikely to derive much benefit from new techniques, and thus unlikely to use them. C. Hadjitheodorou, and W. Heenan.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 382, $3.75 in paper copy, $2.25 in microfiche. Puerto Rico Water Resources Research Institute, Mayaguez, Completion Report, April 1975. 42 p, 3 fig, 2 tab, 13 ref. OWRT A-039-PR(1).

Descriptors: *Water supply, Water demand, Cost analysis, *Optimization, *Water distribution(Applied), *Puerto Rico, Water treatment, Treatment facilities, *Linear programming, Optimum development plans, Cities, Urbanization.
Identifiers: Mayaguez(P.R.).

Increasing costs of supplying water to urban centers necessitate the rational analysis of such water distrbution systems, in an effort to hold the water supply costs to a minimum. Optimization of urban water distribution systems may be investigated by appling linear programming techniques to minimize the costs between water supply and demand areas. The water distribution system of the city of Mayaguez, P. R. was studied. The city is supplied by two water treatment plants of combined capacity 16 million gallons per day. Treated water is supplied by gravity to twenty-two demand areas within the city, through a distribution system consisting of approximately 100 miles of main, ranging from 2 inches to 20 inches in diameter. The costs of distributing water from the supply to the demand areas include pumping raw water to plants, water treatment, water loss, and system maintenance. The distribution system was first analyzed as a classic transportation problem in which demand areas should be supplied in such a way as to minimize the total distribution cost, under the constraints that the total amount supplied by each supply area must not exceed its capacity, and that the amount demanded by an area must be fully satisfied. In addition to the transportation analysis, a network model was developed for the Mayaguez distribution system. The network analysis maintains the same objective function, i.e. it minimizes the total distribution cost, however, different constraints are obtained by applying a material balance of water in, out, and consumed at each network node.

**OPTIMIZING LONG-TERM STREAMFLOW FORECASTS,**
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
J. F. Zuzel, D. C. Robertson, and W. J. Rawls.
Journal of Soil and Water Conservation, Vol 30, No 2, p 76-78, March-April 1975. 1 fig, 4 tab, 5 ref.

Descriptors: *Streamflow, *Forecasting, *Streamflow forecasting, Water balance, *Idaho, Snowmelt, Snowpacks, Hydrology, Runoff forecasting, Runoff, *Optimization, Regression analysis, Model studies, Hydrologic budget, Watershed(Basins).

An optimization technique was used to determine coefficients in a linear forecast model. Runoff volume was the dependent variable for a forecast period. The snow-water contents of n snow courses at a specific time were the independent variables. The procedure minimizes runoff volume errors for specific forecast periods and preserves the hydrologic significance of the forecast equation because all parameters are explainable from a water balance standpoint. The results indicated that the technique effectively reduces long-term streamflow volume forecast errors. Average error was 5% less than the published forecasts for two southwest Idaho drainage basins of 2150 and 7000 square kilometers. (Lee-ISWS)

**IMPROVING THE DESIGN OF PRACTICAL FIELD DRAINAGE,**
Ministry of Agriculture, Fisheries and Food, Cambridge (England). Field Drainage Experiment Unit.
B. D. Trafford.
Soil Science, Vol 119, No 5, p 334-338, May 1975. 4 fig, 14 ref.

Descriptors: *Drainage, *Design, *Optimization, Drainage systems, Depth, Water table, Hydraulic

conductivity, Soil types, Mole drainage, Cost-benefit ratio, Evapotranspiration, Model studies.
Identifiers: *England, Parallel drains, Line sinks, Spacing, Waterlogging.

Mathematical models exist to determine the optimum depth and spacing of field drains from measurements of hydraulic conductivity, or indirect estimates of this. The results are reasonably useful as long as the hydraulic conductivity exceeds perhaps 0.1-0.2 m/day. For heavier, less permeable soils, it is necessary either to use very cheap 'pipes' (mole drains) at the calculated spacing or normal pipes at wider spacing after increasing the hydraulic conductivity by subsoiling. **STREAM ORDERING AND CONTOUR MAPPING,**
University of Western Ontario, London. Dept. of Geography
W. Warntz.
Journal of Hydrology, Vol 25, No 3/4, p 209-227, May 1975. 9 fig, 6 tab, 11 ref.

Descriptors: *Geomorphology, *Drainage density, *Topographic mapping, Streams, Land forming, Topography, Shape, Running waters, Gradients(Streams), Terrain analysis, Quaternary period, Contours.
Identifiers: *Stream order, Physical geography, Contour mapping.

The necessary, sufficient, possible, and likely geometrical and topological characteristics of stream drainage basins of various orders were described. A suggestion was made for experimental topographic mapping to bring it closer to the current theory of spatial hierarchical systems. Stream ordering was examined and a recommendation was offered that streams now considered as of first order be regarded as of zero order. This simplifies mathematical notation for the Horton-Strahler-Woldenberg type of analysis in quantitative geomorphology and has added intellectual interest by facilitating the understanding of the virtually infinite cyclical regress in the patterns of surface features down to individual particle size. Journal of the Waterways, Harbors and Coastal Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No WW2, Paper 11281, p 119-133, May 1975. 9 fig, 6 tab, 8 ref, 1 append. Army Contract DACW 39-73-C-0026.

Descriptors: *Channel improvement, *Levees, *Dikes, *Inland waterways, *River regulation, Floods, Stream erosion, Stream stabilization, Sediment discharge, Navigable rivers, Control, Mississippi River, Missouri River.
Identifiers: *Middle Mississippi River, Kaskaskia River.

The objectives of the 150 years of development along the Middle Mississippi River have been to provide flood protection to people and property on the floodplain by building levees and to provide a suitable channel for navigation by contracting the river channel from St. Louis to Cairo, Illinois. The developments for flood protection and navigation have produced a new river morphology and a different river behavior. The channel position has been relatively stable for at least the last century, although the position and size of islands within the channel have changed from time to time. In the period between 1888 and 1968, the river surface was reduced by approximately one-third, the island area by one-half, and the river bed area by one-fourth. The river channel was deepened for navigation by decreasing channel width with rock and pile dikes. River bed degradation has occurred where the river channel was narrowed. A major influence on flows has been the construction of storage dams on the Missouri River since 1940. The effect of upstream developments has been the reduction in frequency of large flood flows, and the increase in minimum flow. (Singh-ISWS)

Available from the National Technical Information Service, Springfield, Va. 22161, USDC, as EIS-TX-73-1926-F, $5.75 in paper copy, $2.25 in microfiche. December 12, 1973. 139 p, 13 map, 6 fig, 4 graph.

Descriptors: *Channels, *Flood protection, *Recreation facilities, Vegetation, Stagnant water, Landscaping, Mosquitoes, Wildlife, Streams, Parks, *Texas, Diseases, Environmental effects, Floodproofing, Flood plains, Flood forecasting, Flood control, Reservoirs.
Identifiers: *Environmental Impact Statements, Laredo(Tex), Zacate Creek(Tex).

The proposed action involves construction of an improved channel and open space park along Zacate Creek to provide adequate flood protection and recreational facilities for residents of Laredo, Texas. The project will remove refuse and garbage which presently litters the creek. The removed vegetation, caused by the channel construction, will be replaced with grass and landscaping. It is anticipated that stagnant pools, mosquitoes, rats and disease will be eliminated. Wildlife will be displaced from the creek, but probably will relocate in the park and open space area. The primary adverse environmental effect will be elimination of approximately 2.5 miles of a seminatural, intermittent stream and axxociated natural cover and wildlife. Alternatives considered are: Flood proofing, evacuation of the flood plain, land use regulations, flood forecasting and warning with temporary evacuation, flood control reservoir, eight channelization plans, and recreation facilities provided by other agencies. **GROUND-WATER LEVEL IN THE FLOOD PLAIN AND ADJACENT UPLANDS OF THE SANGAMON RIVER,**
Illinois Univ., Urbana. Dept. of Forestry.
D. T. Bell, and F. L. Johnson.
Transactions of the Illinois State Academy of Science, Vol 67, No 4, p 376-383, December 1974. 3 fig, 1 tab, 7 ref. Army DACW 23-73-C-0020.

Descriptors: *Groundwater, *Flood plains, *Surface-groundwater relationships, *Illinois, Water table, Rivers, Streams, Precipitation(Atmospheric), Evapotranspiration, Forests, Ecosystems, Environmental effects, On-site investigations, Evaluation, Data collections.
Identifiers: *Sangamon River(Ill).

The influence of river level, precipitation, and evapotranspiration on the water table fluctuations of the streamside forest ecosystem was determined from observation well data at four locations in the upper Sangamon River bottoms and adjacent uplands. Water levels in the soil profile of the floodplain areas of the streamside forest were strongly controlled by the level of the water in the stream channel. Changes in the upland water table, however, were not closely correlated to river level changes. Precipitation was the environmental variable most strongly influencing changes in the upland groundwater system. Evapotranspiration losses in midtransect areas may exceed infiltration of groundwater from the river and drainage from higher levels during certain summer periods. The strong correlation of the river level to groundwater level indicated that the fluctuation in the level of the water table in the floodplain areas of the Sangamon River was much the same in 1974 as they were in primitive times. An hypothesis concerning the possible changes which may occur with construction of the William L. Springer Project was discussed. A thorough understanding of existing physical environmental conditions in the streamside ecosystem is essential to understanding the streamside forest ecosystem. More complete information on species tolerances is required for assessment of the effects of the changing soil saturation conditions on the streamside forest ecosystem. (Humphreys - ISWS)

**GROUNDWATER LEVELS IN NEBRASKA, 1974,**
Geological Survey, Lincoln, Nebr.
M. J. Ellis.
Nebraska Water Survey Paper No 40, May 1975. 86 p, 12 fig, 1 tab, 21 ref. Published by University of Nebraska Conservation and Survey Division, Lincoln.

Descriptors: *Groundwater resources, *Water wells, *Water level fluctuations, *Nebraska, Water utilization, Industries, Irrigation, Water supply, Observation wells, Hydrologic data, Data collections.

Water levels for the year 1974 and changes from predevelopment levels and previous fall levels are tabulated for approximately 700 wells in Nebraska. Several hydrographs also are included. Use of groundwater for irrigation and industrial purposes has stabilized the economy of large areas in Nebraska. Groundwater is being withdrawn in areas of the state at rates greater than rates of replenishment and significant declines in water levels have occurred. On the other hand, water levels have risen signficantly in some areas of the state where surface water is used for irrigation. (Woodard-USGS)

**SUMMARY OF HYDROLOGIC CONDITIONS IN COLLIER COUNTY, FLORIDA, 1973,**
Geological Survey, Tallahassee, Fla.
H. J. McCoy.
Open-file report FL 47030, 1974. 99 p, 13 fig, 12 ref, append.

Descriptors: *Hydrogeology, *Florida, *Groundwater, *Water balance, Withdrawal, Water yield, Water quality, Basic data collections, Hydrologic data.
Identifiers: *Naples(Fla), Collier County(Fla).

The reaction of the coastal aquifer in Naples, Florida, to the stress of increased water demand was studied during a period of deficient rainfall. When the aquifer is under severe stress--such as in the 1972-73 dry season--the quantity of water percolating downward from the upper shallow zone, through the less permeable confining zone and into the pumping zone is much less than the quantity being withdrawn and large differentials in head (as much as 10 feet) between the shallow and pumping zones occur. Rainfall during 1973 was about 80 percent of the 32-year average in the Naples area,

90 percent of average at Everglades City, and slightly above average at Immokalee. Water levels at the beginning of the 1973 water year (October 1, 1972) were generally a foot lower than at the same time in 1971. The levels recovered to about 1972 water levels in July and August of 1973. Flow characteristics in the five major canals were similar to the groundwater fluctuations. Water quality remained about the same as for 1972 except for fecal and total coliform concentrations at one site in Naples. The fecal coliform concentration set a record high and total coliform concentration was next to the highest on record. (Knapp-USGS)

Water Resources Council, Washington, D.C.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $0.70. October, 1974, 18 p.

Descriptors: *Comprehensive planning, *Institutional constraints, *Energy, *Hydroelectric power, *Water distributio(Applied), Water supply, *Water supply development, *Water quality, Colorado River Basin, Mississippi River, Power system operation, Water delivery, Water cooling, North America, Power plants, Planning, Arid lands, Semiarid climates, Decisionmaking, Financing.

Recommendations include: A detailed national analysis of water availability should be accomplished as soon as projected water requirements for energy-related purposes are fully known, together with that for all competing purposes. Water for energy must be provided to the extent possible through the existing institutional framework. The adequacy of the existing regional and national institutions for management of water and land resources and for resolution of conflicts arising from competing resource uses should be analyzed and needed strengthening accomplished. Environmental hazards and constraints, land use adjustments, and social and economic impacts likely to result from providing necessary water for energy self-sufficiency should be identified and described and the information made available to the public. The states' programs of comprehensive water and related land resources analysis and planning should be given Federal encouragement and assistance to assure capability for adequate and timely decisionmaking at the State and local level and to focus needed attention on energy related water matters. Priority should be given in Federal funding to certain projects, programs, and investgations because of their significant contribution to either early provision of energy, water p energy purposes, or to overcoming present lim tions on water availability for energy purpo (See also W75-09626)

**EFFECTS OF DEFORESTATION ON SLOPES**
Washington Univ., Seattle. Dept. of Civil gineering.
C. B. Brown, and M. S. Sheu.
Journal of the Geotechnical Engineering Divisi Proceedings of American Society of Civil gineers, Vol 101, No GT2, Paper 11141, p 147-1 February 1975. 7 fig, 3 tab, 20 ref, 2 append.

Descriptors: *Slope stability, *Fores *Lumbering, *Soil engineering, Stability, Analy cal techniques, Mathematical studies, Theoreti analysis, Vegetation effects, Root systems, Cre Soil moisture, Water table, Vegetation, Soil phy cal properties, Soil mechanics.

The creep and stability of slopes before and af logging were analyzed. The following effects vegetation were included in the theory: (1) the ro system provides mechanical reinforcement of t soil; (2) vegetation provides a vertical surchang (3) wind in trees causes surface shears and m ments; and (4) soil moisture content and wat level are modified. It was found that immediate after log removal the reduction in the overburd decreases the creep rate. Also, this reduction a the drop in wind loading increases the slope stabi ty. The immediate effect of deforestation is, ther fore, favorable, but adverse effects becom evident when the root system decays and when drop in evapotranspiration causes a rise in th water table. # 5. WATER QUALITY MANAGEMENT AND PROTECTION

## 5A. Identification Of Pollutants

**DETERMINATION OF CHLORIDE IN WATER WITH A HGS/HG2CL2 ELECTRODE,**
Canada Centre for Inland Waters, Burlington (Ontario).
I. Sekerka, J. F. Lechner, and R. Wales.
Water Research, Vol 9, No 7, p 663-665, July, 1975. 1 fig, 4 tab, 13 ref.

Descriptors: *Water analysis, *Chlorides, *Trace elements, Water pollution sources, Natural streams, Industrial water, Waste water(Pollution), *Electrodes, *Pollutant identification, Water pollution, Water chemistry, Ions, Analytical techniques, Pollutants, Electrodes.

The application of a new type of solid state chloride ion sensitive electrode, based on HgS/Hg2Cl2, has been investigated for manual and automated measurements of chloride in natural, industrial and waste waters. TThe electrode display Nerstian response for the range 0.05-3.500 ppm of chloride and can be used for concentrations down to 0.05 ppm. Achieved values of standard deviation, recovery, and comparative tests from a variety of water samples are highly satisfactory. Inherent simplicity and sensitivity together with obtained results demonstrate the usefulness of the proposed method in routine analysis. (Witt-IPC)

**MULTIELEMENT NEUTRON ACTIVATION ANALYSIS OF FRESH WATER USING GE(LI) GAMMA SPECTROMETRY,**
Institutt for Atomenergi, Kjeller (Norway).
B. Salbu, E. Steinnes, and A. C. Pappas.
Analytical Chemistry, Vol 47, No 7, p 1011-1016, June, 1975. 2 fig, 4 tab, 16 ref.

Descriptors: Freshwater, *Water analysis, *Trace elements, *Pollutant identification, *Neutron activation analysis, Analytical techniques, Instrumentation, Water pollution sources, Water chemistry, Water quality, Water properties, Water pollution, Computers, Data processing, Pollutants.

A simple and rapid method for the determination of trace elements in natural fresh water by purely instrumental neutron activation analysis is presented. The method which is based on Ge(Li) gamma spectrometry and computer evaluation of recorded data allows up to 40 elements to be determined without any preconcentration steps. Data illustrating the precision of the method are given. The determination limit is approximately 1 microgram/liter or less for 30 of the elements, provided normal fresh water concentrations of elements giving rise to the most prominent activities (e.g., Al, Cl, and Na) are taken into account. Spectral interferences and other possible sources of systematic errors are discussed and shown to be of moderate importance in most cases. (Witt-IPC)
W75-09362

**SIMULTANEOUS DETERMINATION OF SEVEN TRACE METALS IN POTABLE WATER USING A VIDICON ATOMIC ABSORPTION SPECTROMETER,**
New York State Dept. of Health, Albany. Div. of Labs. and Research.
K. M. Aldous, D. G. Mitchell, and K. W. Jackson.
Analytical Chemistry, Vol 47, No 7, p 1034-1037, June, 1975. 2 fig, 4 tab, 12 ref.

Descriptors: *Potable water, *Water analysis, *Pollutant identification, *Trace elements, *Spectrometers, Zinc, Cadmium, Nickel, Cobalt, Iron, Manganese, Copper, Metals, Chemical analysis, Analytical techniques, Water pollution sources, Water pollution, Waste water(Pollution), Instrumentation, Water chemistry, Water quality, Water properties, Pollutants.
Identifiers: *Atomic absorption spectrometer.

A multichannel atomic absorption spectrometer is used for the determination of Zn, Cd, Ni, Co, Fe, Mn, and Cu in potable waters. Metals are chelated with ammonium pyrrolidine dithiocarbamate at pH 4, and a 10-fold concentration is achieved by extracting into methyl isobutyl ketone. The organic phase is aspirated into an air-acetylene flame, and atomic absorption is measured simultaneously at the resonance lines of these elements by dispersing a 168 nm region of the lamp and flame spectrum across a vidicon array detector. Detection limits from 0.004 to 0.02 microgram/ml have been obtained, with dynamic ranges up to 100 and relative standard deviations of 3% at optimum concentrations. This performance, though poorer than by conventional single-channel atomic absorption spectrometry, is adequate for routine monitoring of public water supplies and most waste waters. (Witt-IPC)
W75-09363

**GAS CHROMATOGRAPHIC DETERMINATION OF SELECTED ORGANIC COMPOUNDS ADDED TO WASTE WATER,**
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
B. M. Austern, R. A. Dobbs, and J. M. Cohen.
Environmental Science and Technology, Vol 9, No 6, p 588-590, June, 1975. 5 tab, 5 ref.

Descriptors: *Water analysis, *Organic compounds, *Gas chromatography, *Pollutant identification, Analytical techniques, Pollutants, Water pollution sources, Water pollution, Separation techniques, Water chemistry, Aromatic compounds, Chromatography.
Identifiers: Styrene, p-Xylene, Ethylbezene, Nitrogenzene, Acetophenone, o-Anisidine, Anethole, Trichloroethylene, Turpentine, Nonylphenol, Dimethyl phthalate, Freon.

Analytical procedures are described for the quantitative determination of styrene, p-zylene, ethylbenzene, nitrobenzene, Acetophenone, o-anisidine, anetkole, trichloroethylene, turpentine, nonylphenol, and dimethyl phthalate, in spiked waste water. Extraction with Freon, concentration of the extract in a Kuderna-Danish apparatus, and gas chromatography are involved. Except for the gas chromatography, the analysis of 10 of the 11 compounds was identical. Trichloroethylene, because of its high volatility, was determined slightly differently. The methods are precise and sensitive to the low parts-per-billion range. (Witt-IPC)
W75-09365

**DETERMINATION OF LEAD IN POTABLE WATERS USING DELVES CUP ATOMIC ABSORPTION SPECTROMETER WITH SIGNAL INTEGRATION,**
New York State Dept. of Health, Albany. Div. of Labs. and Research.
I. S. Maines, K. M. Aldous, and D. G. Mitchell.
Environmental Science and Technology, Vol 9, No 6, p 549-551, June, 1975. 2 fig, 2 tab, 6 ref.

Descriptors: *Potable water, *Lead, *Spectroscopy, *Water analysis, Analytical techniques, *Pollutant identification, Water pollution sources, Trace elements, Water chemistry, Instrumentation, Heavy metals, Pollutants, Water pollution.
Identifiers: Delves cup prodedure, *Atomic absorption spectrometer.

A rapid method for the determination of lead in potable water is described. A 50-200 microliter

sample is dispensed with 50 microliter of gelatin solution into a stainless steel cup, dried, and inserted into an air-acetylene flame. An automated atomic absorption spectrometer measures integrated absorbance. The procedure has a detection limit of 5 microgram of lead/liter, with calibration curves linear to 200 microgram of lead/liter. Typical relative standard deviations are 2.5 and 10.2% for 100 and 20 microgram of lead/liter, respectively. When direct calibration was used, most potable water samples showed low recoveries, but use of standard additions avoided this problem. Fifty potable water samples were analyzed using the Delves cup procedure and solvent-extraction atomic absorption spectrometry. Statistical analysis (Student 't' test) showed excellent correlation between the two procedures. (Witt-IPC)

**BOD AS A POLLUTION INDICATOR (LA DBO COMO INDICADOR DE LA POLUCION),**
G. Van Beneden, and P. Van Beneden.
Investigacion y Tecnica del Papel, Vol 12, No 43, p 25-45, January 1975. 21 ref.

Descriptors: *Biochemical oxygen demand, *Water pollution, *Indicators, Municipal wastes, Industrial wastes, Water pollution sources, Self-purification, Photosynthesis, Mud, Rivers, Analytical techniques, Water pollution effects, Water quality, Bottom sediments, Water pollution, *Pollutant identification.

Techniques used for the evaluation of BOD in urban and industrial waste waters are reviewed. The phenomenon of self-purification of rivers is discussed, together with the roles of mud on the river bottom and of photosynthesis in the self-purification process. Methods of determining the self-purifying power of a river are also considered. (Sykes-IPC)

**WATER ANALYSIS,**
Geological Survey, Denver, Colo.
M. J. Fishman, and D. E. Erdmann.
Analytical Chemistry, Vol 47, No 5, p 334-361R, Annual review issue, April 1975. 663 ref.

Descriptors: *Water analysis, *Analytical techniques, *Bibliographies, *Pollutant identification, Alkali metals, Alkaline earth metals, Hardness(Water), Aluminum, Iron, Manganese, Chromium, Copper, Zinc, Lead, Cadmium, Cobalt, Mercury, Gold, Molybdenum, Boron, Arsenic compounds, Phosphorus, Silica, Halides, Sulfates, Sulfides, Nitrates, Nitrites, Ammonia, Organic matter, Hydrogen ion concentration, Alkalinity, Carbon dioxide, Conductivity, Turbidity, Oxygen, Detergents, Metals, Pesticides, Herbicides, Fungicides, Oxygen demand, Radioisotopes.
Identifiers: Tin, Silver, Vanadium, Bismuth, Uranium, Thorium, Selenium, Antimony, Rare earths, Organic nitrogen, Cyanide, Total carbon.

This review of the literature of analytical chemistry applied to water analysis covers the period from October, 1972 through September, 1974. It includes references to analytical methods for determining the following: alkali metals; hardness and alkaline earth metals; Al, Fe, Mn, Cr, Cu, Zn, Pb, Cd, Ni, Co, Sn, Hg, Ag, Au, Mo, V, Bi, U, Th, B, Se, As, Sb, P, silica, and rare earths; halides, sulfate, and sulfide; nitrate, nitrite, ammonia, organic N, and cyanide; pH, alkalinity, carbon dioxide, conductance, and turbidity; oxygen and other gases; detergents, pesticides, herbicides, and fungicides; oxygen demand and total carbon; organic materials; and radionuclides. Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 512, $3.25 in paper copy, $2.25 in microfiche. Oklahoma Water Resources Research Institute, Stillwater, Completion Report, (1975). 15 p, 7 fig, 7 ref. OWRT A-056-OKLA(1). 14-31-0001-5036.

Descriptors: *Bioassay, Assay, Algae, Systematics, *Analytical techniques, *Pollutant identification, *Electrophoresis, Water treatment, Separation techniques.
Identifiers: Cellular organisms assay, Chlorella vulgaris, Nonuniform field effects, *Dielectrophoresis.

Rapid and selective methods for assaying cellular organisms in fresh water are being sought by applying the selective effects of nonuniform electric fields. A typical alga, Chlorella vulgaris is readily and quickly collected from fresh water medium by the action of nonuniform field effects (NUFE). This alga exhibits a unique spectrum of response, in which the field response of the organism varies strongly with the applied frequency (100 Hz to 4 mega Hz). Since the original NUFE methods were essentially either batch or very small volume procedures (e.g. 0.01 to 0.5 ml), major emphasis has been upon developing continuous treatment techniques more suitable to fresh water problems. This research has developed a successful method called 'stream-centered' continuous dielectrophoresis (SCD). Preliminary tests using living cells have given encouraging results. The method is under active study for it has possibilities of wide application in cell study.

**AN INEXPENSIVE MACROINVERTEBRATE BIOASSAY TABLE FOR USE IN CONTINUOUS-FLOW TOXICITY TESTS,**
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology; and Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental Studies.
A. F. Maciorowski.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 4, p 420-423, April 1975. 3 fig, 4 ref.

Descriptors: *Equipment, Technology, *Design, *Bioassay, Specifications, Laboratory tests, Invertebrates, Toxicity, Pollutant identification.
Identifiers: Continuous-flow bioassay table, *Toxicity tests.

A bioassay apparatus for macroinvertebrates was designed to meet the following criteria: (1) accommodate a large number of tests; (2) be generally acceptable to a wide range of macroinvertebrate organisms; (3) require a minimum of space; (4) be relatively inexpensive. One-gallon glass jugs were used as test chambers in the controlled temperature continuous-flow bioassay table. The apparatus is capable of accomodating fifteen concentrations of a single toxicant. The system is versatile and costs at least 50% less than a comparable system utilizing aquaria. (Katz)

Journal of the Fisheries Research Board of Canada, Vol 32, No 6, p 795-801, Jun 1975. 1 fig, 2 tab, 24 ref.

Descriptors: *Mercury, *Public health, Mammals, *Animal physiology, *Water pollution effects, *Diets, Environmental effects, Food chains, Toxicity, Canada, Absorption, Pollutant identification.
Identifiers: Bioaccumulation, *Tissue analysis, *Selenium, *Metyl mercury, Liver, Muscle, Marine mammals, Terrestial carnivores, Inuit, Ringed seals, Phoca hispada botnica, Sledge dogs, Canis familiaris, Arctic wolves, Canis lupus, Arctic fox, Alopex lagopus, Bearded seals, Erignathus barbatus, Arctic char, Salvelinus alpinus, Caribou, Rangifer tarandus.

Total mercury analyses were made on liver and muscle of caribou and ringed and bearded seals, and on muscle of Arctic char (the principal items in the diet of local people), of Arctic fox, sledge dogs and wolves. About half of the 123 samples were also analyzed for methyl mercury, and some for selenium. Ringed seals showed mean total mercury levels of 27 ppm in liver and 0.73 in muscle. Bearded seals showed levels of 143 in liver and 0.53 in muscle. In the livers, methyl mercury levels were 5.6% of total in ringed seals and 0.38% in bearded seals. Positive and significant correlations of mercury content with age and body weight were found. Blood mercury levels were reported to be above average in people from this community, due to the diet. **SELENIUM DETERMINATION ON FISH TISSUE,**
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
A. R. Beal.
Journal of the Fisheries Research Board of Canada, Vol 32, No 2, p 249-252, February 1975. 2 tab, 17 ref.

Descriptors: *Heavy metals, *Analytical techniques, Equations, Laboratory tests, Methodology, *Pollutant identification, Chemical analysis.
Identifiers: *Selenium, *Tissue analysis, Wet-digestion method, Flourescence measurement, Fish tissue.

A wet-digestion procedure for selenium analysis of fish is described. It involves digestion of the fish homogenate in a nitric-perchloric-sulfuric acid mixture and subsequent complexing with 2,3-diaminonaphtalene. Interfering elements are masked with disodium (ethylene-dinitrilo)-tetraacetate prior to complexing. The slope of standards is consistent and recoveries range from 85 to 100%. (Katz)

Geological Survey, Salt Lake City, Utah. Water Resources Div.
R. L. McAvoy.
In: Advances in Automated Analysis; Proceedings of Technicon International Congress, June 12-14, 1972, New York, NY, p 37-42, 1972. 1 fig, 4 tab.

Descriptors: *Water analysis, *Chemical analysis, *Laboratories, *Automation, Laboratory equipment, Laboratory tests.

In 1970, the Water Resources Division of the U.S. Geological Survey reorganized water quality laboratory activities in the western United States. Central Laboratory is designed to integrate manpower and machinery as a single system to produce its work. The operation of the Central Laboratory during the first year was a success. The workload during the period was about 75% above the planned level. The daily sample input to the laboratory averaged 56 per day and varied from 20 to 150. Residence time of samples in the laboratory during the later part of the test year was no more than 5 days and with priority scheduling was in the order of 1 to 2 days. Complex analyses requiring 60 to 70 tests can be processed in about 3 days, routinely. The mode of operation reduces most analyst bias from the analytical results and increases the accuracy and precision of the results. Productivity per man in the semiautomated laboratory is from 200% to 300% of nonautomated laboratories. (Knapp-USGS)

**EVALUATION OF SAMPLE PREPARATION TECHNIQUES FOR ALGAL BIOASSAYS,**
Utah Water Research Lab., Logan.
D. S. Filip, and E. J. Middlebrooks.
Water Research, Vol 9, No 5/6, p 581-585, May-June 1975. 4 fig, 2 tab, 4 ref.

Descriptors: *Sampling, *Pollutant identification, *Algae, *Bioassay, *Evaluation, *Water analysis, Analytical techniques, Chemistry, Chemical oxygen demand, Eutrophication, Organic matter, Water quality, Farm wastes, Ultraviolet radiation, Phosphorus, Nutrients, Nitrates, Biological properties, Ponds, Feed lots, Runoff, Autoclaves, Membranes, Filtration.
Identifiers: *Sample preparation techniques, Biostimulatory properties, Pasturization, Glass fiber filtration.

The chemical and biostimulatory properties of mesotrophic pond water and eutrophic feedlot runoff were examined after subsamples of each were separately subjected to standard membrane filtration and autoclaving pretreatments for bottle test bioassays. Correspondingly separate subsamples were exposed to ultraviolet light to determine its effectiveness as a possible pretreatment. All three pretreatments fulfilled the requirement of destroying or removing indigenous algae, but each technique substantially altered the water chemistry changing the bioassay results. Filtration removed phosphorus; autoclaving raised the pH value, precipitated salts, and eliminated dissolved carbon dioxide; and ultraviolet light oxidized organic and inorganic nitrogen compounds. (Henley-ISWS)

**AUTOMATIC U.V.-CONTROL SYSTEM FOR RELATIVE EVALUATION OF ORGANIC WATER POLLUTION,**
Vyzkumny Ustav Vodohospodarsky, Ostrava (Czechoslovakia).
M. Mrkva.
Water Research, Vol 9, No 5/6, p 587-589, May-June 1975. 6 ref.

Descriptors: *Pollutant identification, *Organic compounds, *Ultraviolet radiation, *Analytical techniques, *Instrumentation, *Biochemical oxygen demand, Waste identification, Spectrophotometry, Chemistry, Evaluation, Testing, Phenols, Lignins, Humus, Organic wastes, Turbidity, Water quality, Organic matter, Municiple wastes, Industrial wastes.
Identifiers: *Ultraviolet analyzer, *Automatic analyzer, *Flow-through analyzer, Permanganate oxygen demand, Dichromate oxygen demand.

A correlation exists between ultraviolet absorbance at 254 nm and the organic content of some surface and waste water samples. With this in mind, an ultraviolet analyzer was constructed for obtaining continuous absorbance measurements. The instrument was tested in rivers containing organic pollution and in effluents from municipal and industrial sewage plants. During the second part of the investigation, an ultraviolet analyzer was tested that automatically compensates for turbidity. With these instruments, changes in the organic content of a water may be noted immediately and corrective action taken. Conversion factors relating absorbance and chemical oxygen demand for some waters were shown. (Henley-ISWS)

**ADENOSINE TRIPHOSPHATE MEASUREMENTS IN SOIL AND MARINE SEDIMENTS,**
Florida State Univ., Tallahassee. Dept. of Oceanography.
D. M. Karl, and P. A. LaRock.
Journal of the Fisheries Research Board of Canada, Vol 32, No 5, p 599-607, May 1975. 7 fig, 2 tab, 35 ref. NASA Grant NGR-10-004-041.

Descriptors: *Pollutant identification, *Phosphates, *Analytical techniques, Marine biology, Instrumentation, *Phosphorus compounds, Soils, Sedimentation, Estimating, Evaluation, Chemistry, Phosphorus, Analysis, Organophosphorus compounds, Sediments, Laboratory tests, Biomass, Microbiology, Separation techniques, Enzymes.
Identifiers: *Adenosine triphosphate, *Marine sediments, *Sulfuric acid-EDTA method, Bioluminescent reaction, Liquid scintillation counter, Triss method.

A sulfuric acid-EDTA method for extracting ATP from soil and marine sediments was devised. The efficacy of this method was compared to the boiling Tris extraction procedure. Efficiency of ATP recovery from solid substrates typically ranged between 81-94% for the sulfuric acid-EDTA procedure in comparison to a recovery of 3-6% for the boiling Tris buffer. The presence of various ions in the acid extract, however, inhibited light emission in the luciferin-luciferase measurement of ATP. Addition of EDTA to the extract reduced but did not eliminate the ionic interference. An internal ATP standard was thus used to determine the magnitude of the residual interference. (Henley-ISWS)

**PESTICIDES IN FISH FROM A HAWAIIAN CANAL,**
Hawaii Univ., Honolulu. Dept. of Agricultural Biochemistry.
C. D. Shultz, W. L. Yauger, Jr, and A. Bevenue.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 2, p 206-208, February 1975. 2 tab, 7 ref.

Descriptors: *Pesticide residues, *DDT, *DDD, *DDE, *Dieldrin, *Canals, *Hawaii, Pesticides, Environmental effects, Domestic wastes, Food chains, Algae, Water pollution sources, Absorption, Path of pollutants, Pollutant identification.
Identifiers: Elops hawaiensis, Chanos chanos, Bioaccumulation, Tissue analysis.

Samples of sediment, water and biota were taken from a canal that receives drainage from streams that pass through residential Honolulu and runoff from a golf course to determine the degree of pesticide contamination. No PCB's were found in any of the samples; DDT and its metabolites were found in different concentrations in the Ten Pounder (Elops hawaiensis), a carnivore, and milkfish (Chanos chanos), a plankton feeder. The data suggest that small fish accumulate DDT more efficiently than large fish and that algae are efficient accumulators of pesticide residues, contributing residues to fish in waters containing trace amounts of pesticides. (Katz)
W75-09806

**LOSS OF FIVE PESTICIDES FROM CULTURES OF TWENTYONE PLANKTONIC ALGAE,**
Syracuse Univ. Research Corp., N.Y. Life Science Div.
G. L. Butler, T. R. Deason, and J. C. O'Kelley.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 2, p 149-152, February 1975.

Descriptors: *Bioassay, *Algae, *2,4-D, *Pesticides, *Metabolism, *Plankton, *Diazinon, Laboratory tests, Chlorinated hydrocarbon pesticides, Organophosphorus, Absorption, Adsorption, Chemical analysis, Pesticides, Gas chromatography, Pollutant identification, Water pollution effects.
Identifiers: *Atrazine, *Carbaryl, *Methoxychlor.

The loss of atrazine, carbaryl, methoxychlor, diazinon and 2,4-D from actively growing cultures of planktonic algae was used as an indication of metabolic breakdown of the pesticides by algae. Some of the cultures were able to remove significant amounts of diazinon, 2,4-D or methoxychlor but not atrazine. Results indicate which strains of algae may be utilized in experiments determining whether uptake is by absorption or adsorption. (Katz)
W75-09808

**DIFFERENTIAL UPTAKE OF ENDOSULFAN BY THE TISSUES OF MYTILUS EDULIS,**
Queen's Univ., Belfast (Northern Ireland). Dept. of Zoology.
D. Roberts.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 2, p 170-176. February, 1975. 2 fig, 14 ref.

Descriptors: *Absorption, *Adsorption, *Mussels, *Pesticides, *Bioassay, Pesticide residues, Laboratory tests, Pollutant identification, Water pollution effects.
Identifiers: *Bioaccumulation, *Mytilus edulis, *Endosulfan, *Tissue analysis.

Assimilation of Endosulfan could result from direct absorption across exposed tissue surfaces or by ingestion of the pesticide adsorbed on particulate matter in bivalves the path of entry was predicted to be via the gills to the digestive gland. The gills of Mytilus edulis did not assimilate Endosulfan to the levels recorded for the digestive gland and the rise to the maximum level was slower. The digestive gland retained the highest residue level of all tissues, suggesting that it is the major site of Endosulfan assimilation. Assimilation of pesticide into the gonad, mantle and remaining tissues was determined to be via body fluids rather than direct absorption. (Katz)

## 5B. Sources Of Pollution

**FOREST FIRE: EFFECT ON PHOSPHORUS MOVEMENT TO LAKES,**
California Univ., Berkeley. Dept. of Soils and Plant Nutrition.
J. G. McColl, and D. F. Grigal.
Vol 188, No 4193, p 1109-1111, June 13, 1975. 2 tab, 15 ref.

Descriptors: *Lakes, *Phosphorus compounds, *Forest watersheds, *Forest fires, *Runoff, Forest management, Pollutants, Water pollution sources, Water pollution, Forest, Burning, Watershed management, *Minnesota, Lumbering, *Path of pollutants.
Identifiers: Controlled burn.

After a wildfire in the virgin forest of a lake-watershed region in northeastern Minnesota, the phosphorus concentration in the runoff was elevated for 2 years and decreased in the third year. However, there was no increase in the phosphorus concentration of a lake and its input stream. This indicates that, under similar circumstances, controlled burning will not damage streams or lakes by elevating phosphorus levels. (Witt-IPC)

**CLOGGING OF DRIP SYSTEMS FROM METABOLIC PRODUCTS OF IRON AND SULFUR BACTERIA,**
Agricultural Research and Education Center, Lake Alfred, Fla.
H. W. Ford, and D. P. H. Tucker.
In: Proceedings of the Second International Drip Irrigation Congress, p 212-214, (1974).

Descriptors: *Clogging, *Iron bacteria, *Sulfur bacteria, Irrigation, Agriculture, Path of pollutants, *Water pollution sources.
Identifiers: *Trickle irrigation, *Drip irrigation.

Numerous drip irrigation systems have been installed in central and south Florida citrus groves. Many have ceased to function properly because of filter and emitter clogging. The most serious clogging, involving water from shallow and deep wells, has been found associated with a sulfur bacteria. The long filamentous bacteria, stuffed with sulfur from the oxidation of hydrogen sulfide within the irrigation pipes, clog all small openings within a brief period of time. The white, slimy organic-sulfur-iron mass can only be dissolved in pyridine. Another serious clogging factor, from wells containing traces of ferrous iron, has been a filamentous gelatinous iron deposit (ochre) caused by iron bacteria. The sticky sludge adheres to filters and the grooves and orifices of emitters. (See also W75-09423) (Skogerboe-Colorado State)

**USE OF GLYCEROPHOSPHATE FOR FERTILIZATION THROUGH TRICKLE IRRIGATION SYSTEMS,**
California Univ., Davis.
D. E. Rolston, D. L. Hoffman, and R. S. Ravschkolb.
In: Proceedings of the Second International Drip Irrigation Congress, p 416-421, (1974). 3 fig, 9 ref.

Descriptors: *Fertilization, *Fertilizers, *Phosphorus, Irrigation practices, Irrigation systems, Irrigation, Agriculture, Phosphates, Path of pollutants.
Identifiers: *Trickle irrigation, *Drip irrigation, *Glycerophosphate.

There is little doubt after 60 years of scientific investigation with several sources of inorganic phosphate that phosphorus moves very little from point of contact with the soil. The greatest successes in measuring increased movement of phosphorus in the soil profile have occurred with organic forms of phosphorus. The development of new cultural management techniques such as trickle irrigation make the use of a water-soluble, non-corrosive, high analysis source of organic phosphorus an especially desirous material. A material with this capability would be of great value where trickle systems make it extremely difficult to achieve placement by mechanically injecting phosphorus below the soil surface. The movement and sorption of glycerol phosphate was studied in unsaturated soil columns during steady-state displacement of a fertilizer pulse. Fertilizer pulses equivalent to 90 kg/ha application rates were displaced at flow rates between 5 and 15 cm/day. Results demonstrate that glycerol phosphate is capable of being displaced to much greater depths than inorganic forms of phosphorus fertilizer. It is expected that glycerol phosphate can be applied through a trickle irrigation system and be distributed within the wetted root zone. (See also W75-09423) (Skogerboe-Colorado State)
W75-09492

**EVALUATION OF RECOVERY IN A POLLUTED CREEK AFTER INSTALLATION OF NEW SEWAGE TREATMENT PROCEDURES,**
Kentucky Water Resources Inst., Lexington.
R. A. Kuehne.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 499, $3.75 in paper copy, $2.25 in microfiche. Research Report No 85, May 1975. 33 p, 1 fig, 8 tab, 12 ref. OWRT A-047-KY(1). 14-31-0001-3817, 14-31-0001-4017.

Descriptors: *Water pollution, *Streams, *Sewage lagoons, Invertebrates, Fish, *Kentucky, *Sewage treatment, Waste water treatment, Evaluation, Path of pollutants.
Identifiers: *Pollution recovery, Stream order, *Hickman Creek(Kent).

Response of Hickman Creek near Lexington, Kentucky to alleviation from serious sewage pollution was studied from January, 1973 through July, 1974. Wastes are now handled from an efficient secondary treatment facility and four sequential polishing lagoons before chlorination and discharge to West Hickman branch. Physicochemical tests gave no strong indication of residual pollution effects at the start of the study, approximately six months after the treatment facility opened. At low flow a slight oxygen sag, probably associated with algal growth in the lagoons, persists downstream from the outfall. Mean values for turbidity, nitrates and COD are somewhat higher at the outfall than at eleven stations within the basin. Orthophosphates are considerably higher in lagoon discharge than elsewhere in the system, which gains some phosphate from bedrock. While the lagoons place some oxygen demand on West Hickman in the form of unicellular algal growth, they can and do receive surges of input that cannot be accommodated in the treatment plant. They would serve as a buffer to the stream in case of operational malfunction, which could overwhelm the small stream at low flow. The lagoons provide some benefits of tertiary treatment. (Huffsey-Kentucky)

**WATER QUALITY STUDY OF NONPOINT SOURCE OF AGRICULTURAL RUNOFF,**
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
D. R. Andersen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 552, $3.25 in paper copy, $2.25 in microfiche. Completion Report, July 1975. 19 p, 7 fig, 2 tab, 6 ref.

Descriptors: Path of pollutants, Simulation analysis, *Agricultural runoff, *Water quality, *Model studies, Water pollution sources, *Instrumentation, Agricultural watersheds, *Monitoring, *Nebraska.
Identifiers: *Non-point source pollution.

A 7.8 square mile agricultural drainage area was instrumented and monitored for the purpose of obtaining data from an intermediate sized watershed for evaluating available modeling techniques for simulation of the quantity and quality of non-point source agricultural runoff. The study watershed, Dee Creek, is located approximately 15 miles northeast of Lincoln, Nebraska. Instrumentation of the watershed was completed on July 1, 1974. However, due to severe drought conditions, only one runoff event occurred during the last six months of 1974. Samples were collected, during this runoff event for determining various water quality parameters such as solids, phosphorus, nitrogen and chemical oxygen demand. Additional samples were collected of the base flow on a weekly basis and the pH, temperature, dissolved oxygen and conductivity of the stream were monitored on a continuous basis during warm weather. Depth of flow at the control structure where the samples were collected was continuously recorded. However, because of limited runoff in 1974, necessary velocity measurements for calibrating the stream at this point were not completed until June 1975. As a result, limited progress was made relative to evaluation of existing modeling techniques.

**POLLUTION OF IRRIGATION WATERS BY PLANT PATHOGENIC ORGANISMS,**
Nebraska Univ., Lincoln. Dept. of Plant Pathology.
J. R. Steadman.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 504, $3.75 in paper copy, $2.25 in microfiche. Completion Report, June 1975. 26 p, 7 fig, 3 tab, 3 ref. OWRT B-021-NEB(1). 14-31-0001-3907.

Descriptors: *Irrigation water, Pollution, Epidemiology, Pathogenic bacteria, *Nebraska, Nematodes, Pathogenic fungi, *Fungi, *Bacteria, *Path of pollutants, Water pollution control.
Identifiers: *Phytopathogenic bacteria, *Phytopathogenic fungi, *North Platte Project(Neb), Xanthomonas phaseoli, Whetzelinia sclerotiorum.

Systematic sampling of waterways and irrigation runoff from agricultural lands in the North Platte Project of Nebraska in July and August of 1972-1974 demonstrated that phytopathogenic organisms were disseminated. The organisms monitored included the bean common blight bacterium Xanthomonas phaseoli, the bean white mold fungus Whetzelinia sclerotiorum and various nematodes. Patterns of movement of the bacterial and fungal organisms were correlated with previous or current season infection of bean plants. The short-term survival of X. phaseoli in flowing water or filution effects may explain the detection of this organism only in runoff or ditches receiving runoff from common blight-infected bean fields. Sclerotial bodies of W. sclerotiorum remained viable for at least 10-21 days in flowing water and were found throughout the irrigation waterways. Irrigation of beans with contaminated water can result in both common blight and white mold diseases. Sedimentation in a settling basin was not efficient or practical as a method of minimizing this type of organismal pollution. Use of cleaners to remove debris from headwater sources in combination with a method such as chlorination is a promising control. Dissemination of phytopathogenic organisms in irrigation reuse systems as well as agricultural land runoff should be considered in irrigation planning and system designs.

**MOVEMENT OF POLLUTANT PHOSPHORUS IN UNSATURATED SOIL,**
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 509, $3.75 in paper copy, $2.25 in microfiche. Purdue University Water Resources Research Center, Technical Report No 46, June 1974. 41 p, 8 fig, 5 tab, 224 ref. OWRT A-021-IND(5).

Descriptors: *Phosphates, *Nutrient removal, *Waste water disposal, *Unsaturated flow, *Soil moisture tension, Soil water movement, Land disposal, Porosity, Radioisotopes, Water pollution sources, Chemical wastes, *Path of pollutants, Phosphorus.
Identifiers: Freundlich equation, Langmuir equation.

The primary objective was to determine the functional relationship between soil, soil water content and phosphorus concentration capacities in a laboratory system similar to the irrigation of waste water on land. Various concentrations of potassium phosphate solution were admitted to short soil columns on reaction chambers. The phosphate solution also contained a radioactive tracer which

was chemically the same as the major portion of the solute. After reaction with a given soil mixture, the effluent was collected at known time intervals and the amounts of phosphate removed for the time intervals were determined. The Freundlich and Langmuir isotherm equations did not account for differences in soil water pressure and being equilibrium equations neither did they account for time at equilibrium. An exponential equation similar to that of Freunlich is proposed in which soil water pressure as well as time are taken into account. As expected, clay content of the soil influenced the amount of phosphorus adsorbed from the inlet solution. Also of significance was the inlet phosphate concentration and soil water pressure. In an unsaturated state, soil water pressure tends to drain the large soil pores first and the flow lines are diverted into the small pores where more adsorptive surfaces are available.

**SECTORAL AND REGIONAL ECONOMIC IMPACT OF CONTROLLING NONPOINT POLLUTION IN FORESTED AREAS,**
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Economics.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 553, $4.75 in paper copy, $2.25 in microfiche. Purdue University Water Resources Research Center, Technical Report No 53, February 1975. 83 p, 13 fig, 11 tab, 45 ref, append. OWRT B-042-IND(4).

Descriptors: *Multiple-purpose projects, *Water pollution source, *Forest management, *Erosion control, Clear cutting, Plant management, Vegetation regrowth, Land use, Linear programming, Leontief model, Input-output analysis, Soil erosion, Discount rates, Regional analysis, *Indiana, Economic impact.
Identifiers: *Non-point source pollution, Soil losses, Lincoln Hills(Ind).

This is a case study of a forested area in Southern Indiana known as the Lincoln Hills. The direct economic and environmental impacts (soil erosion losses) of a forest resource development project were measured, and their relationship illustrated. Also the indirect economic impact was measured at various levels of resource development. Two techniques of analysis were used, linear programming and Leontief static input-output. Consideration was given to soil erosion control, the rate and manner in which timber is harvested, and the uses to which newly cut timber are put. The control of soil losses has an inverse effect both directly and indirectly on the economy of the area. The rate of harvest should be programmed over time to achieve the highest net benefit. Policy makers should encourage the utilization of the timber by industries in the area for increased income, employment and economic development of the area. (Wiersma-Purdue)

**WATER QUALITY EFFECT OF DIKING A SHALLOW ARID-REGION LAKE,**
Brigham Young Univ., Provo, Utah.
D. K. Fuhriman, L. B. Merritt, J. S. Bradshaw, and J. R. Barton.
Available from the National Technical Information Service, Springfield, Va. 22161. Environmental Protection Agency, Ada, Oklahoma, Report EPA-660/2-75-007, April 1975. 234 p, 7 fig, 9 tab, 28 ref 1BB045 (ROAP 21-ACC, Task 10). R-801400 (Formerly 16080 EVT). Final (6/1/70 - 6/30/74).

Descriptors: *Lakes, Dikes, *Water quality, Utah, Evaporation, Seepage, Arid lands, Sodium, Chlorides, Dissolved solids, *Computer models, Management, Water conservation, Land reclamation
Identifiers: *Lake diking, Shallow lakes, *Utah Lake(Utah)

The inflow, outflow, and in-lake water quality and quantity of Utah Lake in Central Utah were studied over a 36-month period, to determine the effect of a proposed diking project and to develop methodology for determining the effect of diking or other management practices on the quality of water in any lake system. A computer simulation model was developed which is able to analyze the effect of a given management program on the water quality of the lake, particularly as related to the 'conservative salts' present. The simulation model was also used to evaluate the evaporation from the lake by use of a salt balance technique. Results of the research indicate that the diking of Utah Lake will have a positive beneficial effect upon the water quality of the lake and will also result in considerable saving of water and reclamation of valuable land. **STATE-OF-THE-ART FOR THE INORGANIC CHEMICALS INDUSTRY: COMMERCIAL EXPLOSIVES,**
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
J. W. Patterson, and R. A. Minear.
Available from the National Technical Information Service, Springfield, Va. 22161. Environmental Protection Agency, Report EPA-600/2-74-009b, March 1975. 80 p, 10 fig, 21 tab, 32 ref. 1BB036 R/T 21 AZQ 29. R-800857.

Descriptors: *Explosives, *Chemical industry, *Inorganic compounds, Chemical wastes, Reviews, Water pollution control, Pollution abatement, Water pollution sources, *Industrial wastes.
Identifiers: Waste characteristics.

A literature and field study was made of the commercial explosives industry on the basis of products manufactured, plant size, and the nature of the wastewater, the industry may be divided into three segments. One, complex facilities, are large plants manufacturing a variety of explosives and intermediate products. The second category is small specialized formulation plants, typically limited to blending explosives formulations for use in nearby mining activities. The final category is specialty product facilities, devoted to manufacture of select ingredients such as lead azide and other explosives initiators, blasting caps, electric matches and similar appurtenance items. The explosives industry discharges large volumes of wastewater, typically high in BOD, nitrogen, and solids, frequently at extreme pH, and containing trace to high quantities of dissolved and particulate explosives products. Although pollution abatement technology has not been widely implemented within the explosives industry, there is potential for significant abatement of pollutant discharge by good housekeeping practice, application of proven treatment technology and under certain conditions total wastewater containment. **URBAN LAWN INFILTRATION RATES AND FERTILIZER RUNOFF LOSSES UNDER SIMULATED RAINFALL,**
Ball State Univ., Muncie, Ind. Dept. of Natural Resources.
K. A. Kelling, and A. E. Peterson.
Soil Science Society of American Proceedings, Vol 39, No 2, p 348-352, March-April, 1975. 1 fig, 4 tab, 25 ref.

Descriptors: *Path of pollutants, *Urban runoff, *Fertilizers, *Water pollution sources, *Infiltration, *Rainfall-runoff relationshi Nutrients, Pollutants, Vegetation effects, Sto runoff, Eutrophication, Soil-water-plant relatic ships, Soils, Infiltrometers, Surface waters, Sim lated rainfall.

Infiltration runoff measurements were made nine urban lawns by using a sprinkling infiltrom ter in conjunction with the application of complete fertilizer at three rates. The amounts inorganic N, P, and K removed with the runc water were determined. Results of the infiltrati measurements show that the presence of textur and compaction discontinuities within the so profile, formed during building and lawn constru tion, was probably the greatest factor affecting i filtration. Where these discontinuities wer distinc water intake was reduced to about 35% c that fo. a lawn with an undisturbed profile. Fc lawns with similar infiltration characteristics, first order relationship appeared to exist betwee amounts of fertilizer applied and amounts lost. A second order equation, however, best describe the relationship between percent of applied fertil izer in the runoff and 90-min cumulative infiltra tion. When the simulated storm was applied im mediately after fertilizer application, fertilize losses averaged 10.6%; however, when fertilize application was followed by recommended water ing before the intense storm, average losses were reduced to 1.7% of the amount applied. **INTERACTION BETWEEN THE DAILY HEAT BALANCE AND THE TIDAL CYCLE,**
Vrije Universiteit, Amsterdam (Netherlands). Inst. of Earth Sciences.
H. F. Vugts, and J. T. F. Zimmerman.
Nature, Vol 255, No 5504, p 113-117, May 8, 1975. 5 fig, 1 tab, 4 ref.

Descriptors: *Thermal pollution, *Heat balance, *Tidal effects, *Oceans, *Tidal waters, Mathematical studies, Mathematical models, Theoretical analysis, On-site investigations, Currents(Water), Water temperature, Meteorological data, Tides, Temperature distribution, Diurnal, Evaluation, Variability, Mud flats, Frequency.
Identifiers: *Dutch Wadden Sea.

Knowledge of the heat balance and temperature cycle of a tidal-flat sea is relevant to the biology of these areas; temperature is one of the most important physical factors in its ecosystem. Moreover, in planning power stations which will discharge heated effluents in areas of tidal flats, the special character of the heat balance should be taken into account. In a sea area consisting partly of periodically drying tidal flats, the semidiurnal lunar tide, interacting with the daily variation of solar radiation, gives rise to both a beat in the amplitude of the daily water temperature cycle with a period of 14.76 d and a variation of the daily mean temperature with the same period. This is shown theoretically and by observation. Extenstive surveys of temperature fluctuations were made in the Dutch Wadden Sea. Analysis of these data showed that a qualitative agreement exists between the developed theory and field measurements. (Humphreys-ISWS)

**CHEMICAL TRANSPORT BY THE MEKONG RIVER,**
Paris-6 Univ. (France). Laboratoire de Geologie Dynamique.
M. Meybeck, and J. P. Carbonnel.
Nature, Vol 255, No 5504, p 134-136, May 8, 1975. 1 fig, 3 tab, 20 ref.

Descriptors: *Path of pollutants, *Pollutant identification, *Rivers, *Water quality, *Asia, Ion transport, Dissolved solids, Ions, Metals, Calcium, Magnesium, Potassium, Sodium, Silica, Sulfates, Nitrates, Chlorides, Data collections,

Sampling, Analysis, Bicarbonates, Chemical properties.
Identifiers: *Phnom Penh(Mekong River), *Cambodia.

Major rivers are important for an understanding of the overall balance of dissolved and particulate matter carried to the ocean. The Mekong River in Phnom Penh, Cambodia, has a basin area of 663,000 sq km (83% of the total drainage area) and a mean annual discharge of 14,900 cu m/s. At the Phnom Penh station, between January 1961 and December 1962, 546 daily water samples were taken in which temperature, pH, and conductivity were measured. Once a month a complete water analysis was performed. Tabulated values of water quality variation along the Mekong River and dissolved transport rate for SiO2, Ca(2+), Mg(2+), Na(+), K(+), Cl(-), SO4(2-), HCO3(-), and NO3(-1) were given. The total ionic transport for 1961-1962 was 68.5 tons/sq km/yr. This value can be taken as a fair average since the water discharge during this period was 14,970 cu m/s, which is very close to the mean annual discharge. The total dissolved mineral transport rate was 74.8 tons/sq km/yr. (Humphreys-ISWS)

**ASPECTS OF TRACE METAL CONTAMINATION IN THE COASTAL RIVERS OF ISRAEL,**
Hebrew Univ., Jerusalem (Israel).
J. Kronfeld, and J. Navrot.
Water, Air and Soil Pollution, Vol 4, No 1, p 127-134, March 1975. 3 fig, 1 tab, 9 ref.

Descriptors: *Trace elements, *Heavy metals, *Water pollution sources, *Sediments, Wastes, *Metals, Soil chemical properties, Environmental effects, Sewerage, Industrial wastes, Chemical wastes, Groundwater, Permeation, Sampling, Soil analysis, Cadmium, Cobalt, Copper, Cadmium, Nickel, Lead, Mercury, Zinc, Public health.
Identifiers: *Israel, Aquatic balance, Ayyalon River, Gadura River, Qishon River Hader River(Israel).

Nine trace elements of biological concern: Cr, Co, Cu, Cd, Ni, Pb, Hg, Zn, and Ag were investigated in the sediments of coastal streams in Israel. The Ayyalon, Gadura, Qishon and Hadera rivers contain sediments exhibiting sever pollution effects due to domestic and/or industrial sewage. The danger of infiltration through soils into the groundwaters and exposure of nearshore fauna to sediments contaminated by possibly toxic trace metals is disscussed as well as high Pb and Zn levels near major highways. **WATER-RESOURCES INVESTIGATIONS IN THE FORT UNION COAL REGION, NORTH DAKOTA, 1974-75.**
Geological Survey, Bismarck, N.Dak.
Open-file report, January 1975. 42 p, 10 fig.

Descriptors: *Water pollution sources, *Coal mine wastes, *Water quality, *North Dakota, Reviews, Project purposes, Publications, Surface waters, Groundwater, Water pollution effects, Water pollution control, Hydrologic data, Data collections, Bibliographies.
Identifiers: *Fort Union coal region(N Dak).

Owing to the current emphasis on energy development, a rather large number of geologic and hydrologic studies either are underway or are proposed by a number of agencies and private companies working in the Fort Union coal region of North Dakota. The purpose of this report is to inform other agencies, private companies, and the public in general of the on-going and recently completed work by the Water Resources Division of the U.S. Geological Survey in the Fort Union coal region. The work done by the Water Resources Division in North Dakota is listed by sequential project identification number. Some of the projects are primarily concerned with data collection. Others involve interpretation in addition to data collection. A summary of each project includes objectives, cooperators, and availability of the report. (Woodard-USGS)

**CHANGES IN CHEMICAL QUALITY OF WATER, CEDAR BLUFF IRRIGATION DISTRICT AREA, WEST-CENTRAL KANSAS,**
Geological Survey, Lawrence, Kans.
R. B. Leonard.
Kansas State Geological Survey, Lawrence, Chemical Quality Series No 1, April 1975. 72 p, 37 fig, 3 plate, 12 tab, 45 ref.

Descriptors: *Water quality, *Irrigation water, *Chemical analysis, *Irrigation effects, *Kansas, Hydrologic data, Data collections, Sampling, Surface waters, Groundwater, Soil analysis, Inorganic compounds, Pesticides, Water levels, Discharge(Water), Well data.
Identifiers: *Cedar Bluff area(Kans), Water quality changes.

The Cedar Bluff Irrigation District in west-central Kansas diverts water from the Smoky Hill River to irrigate about 6,000 acres. Although drainage from irrigated land replenishes groundwater in transient storage and augments low flow in the river, the drainage adversely affects the chemical quality of the related water. Specific conductance of the irrigation water increased progressively from 800 to 980 micromhos per centimeter at 25 deg C between 1964 and 1971. The percent composition of this calcium-sulfate type water remained relatively constant. The use of water for irrigation in the district and the increase of drainage to low flow have not caused serious degradation of chemical quality of the Smoky Hill River. The data include measurements of precipitation, water levels and water discharge; lithologic and gamma-ray logs of observation wells and test holes; chemical analyses of groundwater, surface water, and soil; analyses for pesticides in ground and surface water; and selected particle-size analyses of soil. (Woodard-USGS)

**OCCURRENCE OF PESTICIDE RESIDUES IN FOUR STREAMS DRAINING LAND-USE AREAS IN PENNSYLVANIA,**
Geological Survey, Harrisburg, Pa.
J. F. Truhlar, and L. A. Reed.
Available from NTIS, Springfield, Va 22151 as PB-242 770/AS, $3.75 in printed copy; $2.25 in microfiche. Water-Resources Investigations 6-75, June 1975. 23 p, 5 fig, 5 tab, 7 ref.

Descriptors: *Water pollution sources, *Pesticides, *Insecticides, *Pennsylvania, Surface waters, Fish, Soils, Land use, Sampling, Chemical analysis, DDT, Dieldrin, Agricultural chemicals, Orchards.

Samples of water, bed material, fish, and soil were collected in four small drainage basins in Pennsylvania in 1969-71 and analyzed to determine the concentrations of chlorinated-hydrocarbon insecticides. Water samples only were also analyzed for phenoxy-acid herbicides. Each basin studied represents a predominant land-use classification--forested, general farming, residential, and orchard farming. All water and fish samples showed pesticide concentrations less than the U.S. Public Health Service's (1969) recommended maximum permissible concentration. However, no fish were found in the orchard area stream at the time collection was attempted. DDT or one of its metabolites was the most frequently occurring insecticide and was detected in all media sampled except the forested-area soil. The highest observed combined concentration of DDT and its metabolites in storm-runoff samples was 11.4 micrograms per litre in a sample collected from the residential area stream, but the median was higher (0.12 microgram per litre) in the orchard area than in the residential area (0.02 microgram per litre). Dieldrin was the second most frequently occurring insecticide. Other insecticides detected were chlordane, heptachlor epoxide, lindane, and a trace of aldrin in one fish sample. (Woodard-USGS)

**A CASE STUDY OF MINE WATER QUALITY DETERIORATION, MAINSFORTH COLLIERY, COUNTY DURHAM,**
Teesside Polytechnic, Middlesbrough (England). Dept. of Civil and Structural Engineering.
T. Cairney, and R. C. Frost.
Journal of Hydrology, Vol 25, No 3/4, p 275-293, May 1975. 9 fig, 2 tab, 10 ref.

Descriptors: *Water quality, *Acid mine water, *Coal mines, *Dewatering, Pyrite, Iron bacteria, Shafts(Excavations), Groundwater, Oxidation, Pumping, Leaching, Water levels, Limestones, *Water pollution, Water quality control.
Identifiers: *Great Britain, *Magnesian limestone, Mineralization, Continuous pumping, Off-peak pumping.

Little work is directed to the causes of water quality deterioration when flooding of deep coal mines occurs. The present research suggested that while the usually accepted factors - the presence of iron disulphides, oxygen, and water - are essential controls, the pumping regime in operation is also of prime importance. It was argued that significantly less polluting discharges can be achieved when the mine water is held at a constant level. (Visocky-ISWS)

**RAPID TEMPERATURE REDUCTION OF THERMAL DISCHARGE,**
Ottawa Univ. (Ontario). Dept. of Civil Engineering.
R. D. Townsend, and D. L. Egar.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY5, Paper 11312, p 529-541, May 1975. 9 fig, 8 ref, 2 append.

Descriptors: *Temperature, *Hydraulic jump, *Laboratory tests, *Mixing, *Thermal pollution, Model studies, Diffusion, Open channel flow, Hydraulics, Discharge(Water), Thermal powerplants, Effluents, Outlet works, Heating, Waste dilution.

A laboratory model study was conducted to investigate increasing the rate of temperature reduction by optimizing the mixing process between a heated effluent stream and a cool, tempering water flow introduced on the side of the discharge channel. The oblique hydraulic jump was used as the mixing agent. The results were compared with the standard dilution method in which the cooler stream is entrained by jet-induced turbulence. The standard techniques for predicting the location of the jump proved inadequate in the study configuration. Temperature distributions were observed throughout the flow field in order to determine mixing efficiency. Results indicated that the tempering and effluent flows were completely mixed by the hydraulic jump in a much shorter length of channel than was required by the standard jet mixing dilution process. **A SALINE INTRUSION INTO SENECA LAKE, NEW YORK,**
Hobart and William Smith Colleges, Geneva, N.Y. Earth and Space Sciences Program.
W. F. Ahrnsbrak.
Limnology and Oceanography, Vol 20, No 2, p 275-278, March 1975. 3 fig, 3 ref.

Descriptors: *Path of pollutants, *Lakes, *New York, *Saline water intrusion, *On-site investigations, Sampling, Evaluation, Water temperature, Freshwater, Water pollution sources, Measurement, Salinity, Saline water, Movement, Conductivity, Water properties, Electrical conductance, Thermocline.
Identifiers: Seneca Lake(NY), Saline plume.

A warm, saline plume sinks, upon entering Seneca Lake, to just above the thermocline, 15 to 25 m deep. At that depth, based on vertical soundings of temperature and conductivity, the plume spreads radially, maintaining a distinct identity for 150-200 m. Temperature measurements alone suggest that the plume retains its identity to a distance of 1 km from its origin. (Humphreys-ISWS)

**DEOXYGENATION IN NATURAL STREAMS,**
Nebraska Natural Resources Commission, Lincoln. Data Bank.
M. K. Bansal.
Water Resources Bulletin, Vol 11, No 3, p 491-504, June 1975. 3 fig, 1 tab, 27 ref.

Descriptors: *Oxygen requirements, *Natural streams, *Oxygen, *Water quality, *Biochemical oxygen demand, Streams, Inorganic compounds, Oxygen demand, Model studies, Mathematical models, Phosphates, Nitrates, Nutrients, Water pollution, Organic matter, Dissolved oxygen, Water properties, Reaeration, Dispersion, Organic loading, Respiration, Reynolds number, Oxidation.
Identifiers: *Deoxygenation, Carbonaceous matter.

The deoxygenation process in which carbonaceous BOD is biochemically oxidized to reduced inorganic compounds is of great significance in the oxygen demand of stream waters. The BOD decay rate traditionally determined in a laboratory might not necessarily be the same as estimated for a natural stream. The variation in biochemical activity could occur due to differences in adsorption, dispersion, and biophysical processes taking place in the two environments. The first stage biochemical oxygen demand and benthal oxygen demand that occur simultaneously in a stream were considered together to calculate the gross rate of deoxygenation in polluted waters. The available data on deoxygenation measurements were analyzed to calculate the carbonaceous BOD rate constants in natural streams. The analysis indicated that the dimensionless deoxygenation parameter is a function of the ratio of the Reynolds number and Froude number of flow. The functional relationship between these two parameters essentially follows a straight line on a log-log plot. The applicability of the relationship does not depend on the volume of the organic load, size, or location of the stream. (Henley-ISWS)

**SEWAGE DISPOSAL AND WATER SUPPLY ALTERNATIVES ON THE BASIS OF WATER QUALITY AND ECONOMIC CRITERIA,**
Michigan Univ., Ann Arbor.
R. Rajagopal.
Available from University Microfilms Inc., Ann Arbor, Michigan, 48106, Order No 74-25302. PhD Thesis, 1974, 178 p.

Descriptors: *Sewage disposal, *Water supply, Costs, *Groundwater, *Michigan, Statistical analysis, Construction costs, Computers, Model studies, Information retrieval, Economics, *Water quality standards, Water pollution sources.

Groundwater quality and economic factors as affected by sewage disposal and water supply alternatives for small rural townships in transition surrounding an urban center were studied. Water quality and cost data obtained from the surrounding townships in the Grand Traverse region of the State of Michigan formed the basis of this analysis. Efforts were divided into three parts: a set of chemical measurements was statistically analyzed and models for nitrate-N in groundwater were developed on the basis of land use, soil and well characteristics; with the help of a sample survey, equations for individual and community sewage disposal and water supply construction costs were formulated; and the above models, along with equations for population growth and distribution, were programmed to form a general interactive computer information system. This information system provides cost of construction of individual and community sewage disposal and water supply facilities and average nitrate-N found in groundwaters for any choice of township, land use and population growth for any future time horizon. **A STUDY OF THE SURFACE FLUID FLOW CHARACTERISTICS OF THE NEW YORK BIGHT AND THE DEVELOPMENT OF RESEARCH DATA DISPLAY TECHNIQUES,**
Earth Satellite Corp., Washington, D.C.
R. T. Macomber, R. L. Mairs, and D. T. Stanczuk.
Final Report, October 15, 1974. 63 p, 25 fig, NOAA Contract No 3-35336.

Descriptors: *Data collections, *Data processing, Satellites(Artificial), *Coasts, *Water pollution, Ocean circulation, Sewage disposal, Littoral drift, Dispersion, Currents(Water), Tides, New York, *Remote sensing, Path of pollutants.
Identifiers: *New York Bight, Environmental quality, *Data analysis, Dredge spoil, Marine environment.

The need exists for (1) a demonstration of remote sensing data acquisition applied to studies of the coastal marine ecosystem in the New York Bight area, and (2) a demonstration of the remote sensing based information products which an be provided to area users. An effort has been made to demonstrate the applicability of remote sensor records to the study of circulation, dispersion, and related environmental characteristics, and to develop remote sensor-derived products for potential users in the New York Bight area. It is hoped that this effort will lead to a demonstration of the effectiveness of conversion of remotely revised data and ground truth data into information products which can be used for routine decision making. **OFFSHORE DEVELOPMENT AND MARINE POLLUTION,**
United Nations Secretariat. Office of Legal Affairs.
M. Hardy.
Ocean Development and International Law Journal, Vol 1, No 3, p 239-273, 1973. 73 ref.

Descriptors: *International law, *Oil pollution, *Offshore platforms, *Coastal structures, *Pollution abatement, International waters, Legal aspects, Treaties, Oil industry, Water pollution, Aquatic environment, Engineering structures, Coasts, Drilling, Oceans, Water pollution control, Abatement, Pollutants, Water law, Administration, Legislation, Africa.
Identifiers: Coastal zone management, Hazardous substances(Pollution), International agreements, Territorial waters.

Offshore development, navigation, and fishing are the major economic uses of the sea. The problem of accommodating different interests of the international community in the marine environment in a legal order, with particular focus on marine pollution caused by offshore production of oil, is discussed. The range of techniques, administrative and legal, which are available for coping with the problem of allowing offshore development to proceed, while taking steps to ensure that marine pollution from this source is kept under control, is evaluated. The position under international law and the action taken by international bodies such

as the U.N. Seabed Committee, IMCO, the Stockholm Conference, and OAU are described. Further, national legislation relating to marine pollution caused by offshore mineral development in various countries is surveyed. Generally, the problems must be examined in terms of four issues: the application of adequate information, of adequate supervision, of adequate technical knowledge and equipment, and of suitable sanctions. Although international treaties are matters for future inquiry, the present exigencies require national efforts and co-operation on a regional and sub-regional level. (Fernandez-Florida)

## 5C. Effects Of Pollution

**DISTRIBUTION AND DYNAMICS OF AQUATIC INSECTS IN THE ELK CREEK EXPERIMENTAL WATERSHED, LUBRECHT FOREST, MONTANA,**
Montana Univ., Missoula. Dept. of Zoology.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 510, $3.25 in paper copy, $2.25 in microfiche. Research Report No 61, Montana University Joint Water Resources Research Center, Bozeman, March 1975. 21 p, 1 fig, 3 tab, 15 ref. OWRT A-050-MONT(1).

Descriptors: *Aquatic insects, Fauna, Environmental effects, Environment, *Ecological distribution, *Montana, Watersheds(Basins), *Regression analysis, *Correlation analysis, Benthos, Streams.
Identifiers: *Stream ecology, *Ecological research, Elk Creek experimental watershed(Mont).

Regression and correlation analysis of insect abundance and environmental factors and of species-species relationships indicates low predictive power for physical factors and much stronger biological correlations. With improved physical measurements, least squares regression analysis should be useful in the estimation of benthos densities in streams. Response surfaces computed from funcational regressions on abundances of co-occurring species indicated quantitative differences in habitat selection by stream insects. (Holje-Montana State)
W75-09528

**SILT REMOVAL FROM A LAKE BOTTOM.**
Lake Herman Development Association, Inc., Madison, S. Dak.
Available from the National Technical Information Service, Springfield, Va. 22161. Environmental Protection Agency, Report EPA-660/3-74-017, February 1975. 37 p, 6 fig, 2 tab, 4 ref. 1BA031. 16010 ELF.

Descriptors: *Eutrophication, Water pollution effects, Sediments, Lakes, *Sediment control, *South Dakota, *Dredging, Lake beds, Silts.
Identifiers: *Lake Herman(SoDak), *Silt removal, *Lake bottoms.

Dredging was used as a method to remove 62,600 cubic yards of silt from Lake Herman during the summers of 1970, 1971, and 1972. The silt was transported via a pipeline to a silt deposit area adjacent to the northeast corner of the lake. The water removed by the dredging process drained by gravity along a gradual slope, dropping its silt and losing nutrients to the lush vegetation, and eventually returned to the lake. In the bay area where dredging occurred water depth was increased from 5.5 feet to approximately 11 feet. There was no significant change in the levels of biological organisms or nutrients, except for phosphorus, which increased just after the dredging began. Whether dredging actually caused the increase is still debatable. Vegetation in the deposit area became extremely lush. Water returning to the lake from the deposit area was lower in nutrients than the water in the lake. (EPA)

**SECONDARY IMPACTS OF TRANSPORTATION AND WASTEWATER INVESTMENTS: REVIEW AND BIBLIOGRAPHY,**
Environmental Impact Center, Inc., Newton, Mass.
S. E. Bascom, K. G. Cooper, M. P. Howell, A. C. Makrides, and F. T. Rabe.
Available from the National Technical Information Service, Springfield, Va. 22161. Environmental Protection Agency, Report EPA-600/5-75-002, January, 1975, 276 p. 1HA095 21 ART 11. EQC 317.

Descriptors: *Bibliographies, Publications, Analytical techniques, Community development, Land use, Water resources, Planning, Data collections, Environment, *Investment, Local governments, Waste water treatment, Highways, *Reviews, *Transportation, Regional development, Data storage and retrieval, Environmental effects.
Identifiers: *Environmental impacts.

A review is presented of over fifty major studies and three hundred relevant reports related to secondary environmental impacts on various forms of public investments, e.g. land based transportation and wastewater collection systems. The Bibliography is organized into four sections: Section I is subdivided into: (a) a review of secondary impacts classified according to type of investment (highways, mass transit, and wastewater collection systems); (b) where possible, according to type of secondary effects (economic, social and land use); and (c) a brief summary of modeling techniques which may be utilized to analyse and project likely secondary environmental impacts. Section II condenses the findings of about fifty major studies related to land transportation and wastewater treatment systems. Section IV classifies these literature studies by: (a) impact; (b) investment; (c) geographic area examined; (d) type of study; and (e) type of analytic techniques used in assessing secondary effects. **THE EFFECT OF SULFATE AND MANGANESE DIOXIDE ON THE RELEASE OF PHOSPHORUS FROM LAKE MENDOTA SEDIMENTS,**
Wisconsin Univ., Madison. Water Chemistry Lab.
D. M. Olson.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 515, $4.25 in paper copy, $2.25 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report, June 1975. 47 p, 17 fig, 1 tab, 13 ref, 4 append. OWRR A-035-WIS(1), 14-31-0001-3050, 14-31-0001-3250.

Descriptors: *Phosphorus, *Lake sediments, *Eurtophication, *Sulfates, *Manganese oxides, Wisconsin, Lakes, Iron, Water quality standards, Water pollution effects.
Identifiers: Lake Mendota(Wisc).

The recommendation of the National Technical Advisory Committee to the Secretary of the Interior to limit the addition of sulfate or manganese oxide to lakes containing iron in the hypolimnion was evaluated by laboratory experiments in which Lake Mendota sediments were placed in carboys and incubated in the presence of various amounts of sulfate and manganese dioxide. Differences were noted in the quantity of orthophosphate released under anaerobic conditions between carboys that received 1 and 5 mg/l Mn02 and 0 and 10 mg/l MnO2. However, the significance of the observed difference is uncertain in view of the scattered iron data, the level of sulfate maintained, and the oxidizing capacity of the added MnO2. A direct relationship was observed between the quantity of added MnO2 and Mn(II) concentration. The addition of sulfate did not show a direct relationship to the quantity of orthophosphate released under anaerobic conditions. The results of these experiments are concluded to be insufficient to either support or reject the recommendation of the National Technical Advisory Committee.
W75-09619

**THE EFFECT OF BASIC CUPROUS CARBONATE ON THE STATE OF THE LIVER IN JUVENILE AMUR AUTUMN CHUM (ONCORHYNCHUS KETA INFRASP. AUTUMNALIS),**
Tikhookeanskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva i Okeanografii, Vladivostok (USSR).
A. A. Zhirnova, A. M. Kolgayev, and N. N. Shirokova.
Journal of Ichthyology, Vol 14, No 3, p 453-456, 1974; 2 fig, 15 ref.

Descriptors: *Salmonids, *Chum salmon, *Growth stages, *Juvenile growth stages, *Copper compounds, Cytological studies, Inorganic compounds, Fish physiology, Laboratory tests.
Identifiers: *Oncorhynchus keta, Fingerlings, *Cuprous carbonate, Tissue analysis.

Basic cuprous carbonate had no adverse effects on the development of juvenile Amur Autumn Chum, Oncorhynchus keta. The weights of fingerlings were equivalent for both test and control groups although there was more intensive resorption of the yolk sac in the experimental group. The antiseptic had no significant pathological effects on the liver, nor were differences discovered in copper content in the liver cells. (Katz)
W75-09668

**EFFECTS OF SALINE WATER FROM NORTH DAKOTA LAKES ON SURVIVAL OF FATHEAD MINNOW (PIMEPHALES PROMELAS) EMBRYOS AND SAC FRY,**
North Dakota State Univ., Fargo. Dept. of Zoology.
B. L. Burnham, and J. J. Peterka.
Journal of the Fisheries Research Board of Canada, Vol 32, No 6, p 809-812, June 1975. 2 tab, 9 ref.

Descriptors: *Minnows, *Saline water, *Growth stages, Salt tolerance, Fish physiology, Toxicity, Embryonic growth stage, Fry, Sodium chloride, Sodium sulfate, Lethal limit, Laboratory tests, Bioassay, On-site investigations, *North Dakota, Lakes, Water pollution effects, Pollutant identification.
Identifiers: *Fathead minnows, *Pimephales promelas, Sac fry, Tissue analysis, Bioaccumulation.

Eggs and sac fry of the fathead minnow (Pimephales promelas) were subjected in the laboratory to various dilutions of water obtained from four saline lakes in North Dakota; three were sodium sulfate-, one a sodium-chloride-type lake. In water from the latter, the percent of fertilized eggs surviving as sac fry for 5 days remained the same as the percent hatched: about 90% at treatment levels of 500-12,000 micromhos, and 68% in undiluted lake water of 18,000 micromhos. In sodium sulfate-type water, however, about 92% of the fertilized eggs hatched at treatment levels of 500 up to only 6,000 micromhos, with about 82% living as sac fry for 5 days in water from two of the lakes and only about 54% living for 5 days in dilutions

made from the most saline lake (lake water of 25,000 micromhos). No sac fry survived for 5 days after hatching in sodium-sulfate-type water of 12,000 micromhos. From laboratory bioassays and field observations, it is estimated that sodium sulfate-type water exceeding 8,000 micromhos during reproductive periods may decrease survival of sac fry. (Katz)
W75-09669

**THE EFFECT OF DIFFERENT OXYGEN CONDITIONS DURING INCUBATION ON THE SURVIVAL AND SOME OF THE DEVELOPMENTAL CHARACTERISTICS OF THE 'VERKHOVA' (LEUCASPIUS DELINEATUS) IN THE EMBRYONIC PERIOD,**
Akademiya Nauk SSR, Moscow. Inst. of Evolutionary Morphology and Animal Ecology.
M. V. Gulidov.
Journal of Ichthyology, Vol 14, No 3, p 393-397, 1974. 4 tab, 2 ref.

Descriptors: Freshwater fish, Growth stages, *Growth rates, *Fish eggs, *Embryonic growth stage, *Oxygen requirements, *Toxicity, *Dissolved oxygen, *Fish physiology, Laboratory tests, Life cycles, Lethal limit, Respiration.
Identifiers: *Leucaspius delineatus, *Cyprinids, Oxygen concentrations, Developmental stages, Blastoderm.

Four series of experiments were carried out on the incubation of the eggs of Leucaspius delineatus from the stages of commencement of over-growth of the yolk sac by the blastoderm-closure of the yolk plug to the hatching of embryos at different oxygen concentrations. The data obtained are examined in the light of the ecological developmental characteristics of L. delineatus under natural conditions. (Katz)

**SELENIUM TOXICITY ON THE EARLY LIFE STAGES OF ZEBRAFISH (BRACHYDANIO RERIO),**
Ottawa Univ (Ontario). Dept. of Biology.
A. J. Niimi, and Q. N. Laham.
Journal of the Fisheries Research Board of Canada, Vol 32, No 6, p 803-806, June 1975; 2 tab, 18 ref.

Descriptors: Fish, *Growth stages, *Embryonic growth stage, *Larvae, *Inorganic compounds, Groundwater, Surface water, Environmental effects, Fish eggs, Animal physiology, Aquaria, Lethal limit, *Toxicity, Mortality, Laboratory tests, Water pollution effects.
Identifiers: *Selenium, *Zebrafish, Brachdanio rerio, Fish embryology.

Embryos at four stages of development and newly hatched larvae of zebrafish (Brachydanio rerio) were exposed to selenium concentrations between 0.5 and 10 micrograms per milliliter to establish toxic levels. Embryo mortality was negligible at all selenium concentrations. Following hatching, mortality among the larvae sharply increased at concentrations of 3 micrograms per milliliter or greater irrespective of the embryonic stage when exposed. For most treatments, over 90% of the larvae died within 10 days of hatching. The mortality rate for larvae exposed to selenium after hatching was slightly less. (Katz)

**EFFECTS OF KOKANEE SALMON (ONCORHYNCHUS NERKA) DECOMPOSITION ON THE ECOLOGY OF A SUBALPINE STREAM,**
California Univ., Davis. Div. of Environmental Studies.
S. E. Richey, M. A. Perkins, and C. R. Goldman.
Journal of the Fisheries Research Board of Canada, Vol 32, No 6, p 817-820, June 1975. 2 fig, 14 ref.

Descriptors: *Salmonids, *Cycling nutrients, *Decomposing organic matter, *Primary productivity, *Food chains, *Food webs, *Biomass, *Spawning, *Phosphorus, Streamflow, Ecosystems, Life cycles, Sampling, Plankton, Downstream, Upstream, Water pollution effects.
Identifiers: *Kokanee salmon, Oncorhynchus nerka, *Salmon carcasses, Autotrophs, Heterotrophs.

The role of kokanee salmon (Oncorhynchus nerka) carcass decomposition in the nutrient cycles and energy flow of a subalpine stream was investigated during a season (1970-1971) of high spawner abundance and a season (1972-1973) of low spawner abundance with a December storm flushing the stream of carcasses. Primary production, periphyton biomass, heterotrophic activity, and nutrient concentrations were greater downstream than upstream during the peak carcass decomposition of 1971, whereas they were the same at other times of that year and in 1972-73. Calculations showed that upstream-downstream differences in phosphate could be accounted for by the salmon carcasses. (Katz)
W75-09672

**THE BOTTOM FAUNA OF CHINA CLAY WASTE DEPOSITS IN MEVAGISSEY BAY,**
Otago Univ., Portobello (New Zealand). Marine Biological Station.
P. K. Probert.
Journal of the Marine Biological Association of the United Kingdom, Vol 55, p 19-44, 1975. 10 fig, 4 tab, 67 ref.

Descriptors: *Sediments, *Mine wastes, *Industrial wastes, *Benthic fauna, Water pollution effects, Environmental effects, Benthos, Silts, Clays, Sampling, Distribution, Mollusks, Worms, Biological communities, Water pollution control.
Identifiers: *China Clay waste, Polychaetes, Echinoderms, *New Zealand, Mevagissey Bay(NZ).

A survey of the infaunal macrobenthos of fine-grained china clay waste deposits in Mevagissey Bay, Cornwall, was carried out before the cessation of these discharges. The results are compared with earlier studies in the bay and the grosss structure and extent of the bottom fauna associations are described, from which it is hoped that major post-pollution changes may be followed. The observed faunal impoverishment in the nearshore regions of the bay is attributed to sediment instability resulting from high rates of deposition combined with certain physical properties of the sediment preventing the establishment of those species, especially tubicolous polychaetes, which tend to bind the sediment and make it more suitable for colonization by other benthic organisms. (Katz)
W75-09673

**EFFECT OF DDT ON DISCRIMINATING ABILITY OF RAINBOW TROUT (SALMO GAIRDNERI),**
Alberta Univ., Edmonton. Dept. of Zoology.
P. C. McNicholl, and W. C. MacKay.
Journal of the Fisheries Research Board of Canada, Vol 32, No 6, p 785-788, June 1975.

Descriptors: *Organoleptic properties, *DDT, *Light intensity, *Chlorinated hydrocarbon pesticides, *Salmonids, *Rainbow trout, Lethal limit, Fish physiology, Water pollution effects.
Identifiers: *LD50, *Visual discrimination, Linear equations.

Rainbow trout, Salmo gairdneri, trained to discriminate between a bright (723 lx) and a dim (22 lx) light were tested to determine the minimum difference in light intensity they could distinguish before and 71 h after being fed DDT orally at 0,30,50 and 80% of the LD50 dose. Discriminating ability decreased linearly with increased dose, while performance and retention remained unaffected. (Katz)
W75-09674

**A COMPARATIVE STUDY OF THE TOLERANCE OF TWO FRESHWATER PLANARIANS, DUGESIA TIGRINA AND POLYCELIS FELINA, TO LOW OXYGEN LEVELS, (ETUDE COMPARATIVE DE LA TOLERANCE AUX BASSES TENSIONS D'OXYGENE CHEZ DEUX PLANAIRES D'EAU DOUCE, DUGESIA TIGRINA ET POLYCELIS FELINA),**
Lyon 1 Univ., Villeurbanne (France). Departement de Biologie et Zoologie.
R. Russier-Delolme.
Annales de Limnologie, Vol 10, No 3, p 311-322 1974. 1 fig, 3 tab, 15 ref. English abstract

Descriptors: *Aquatic animals, *Dissolved oxygen, *Resistance, *Oxygen demand, Water properties, Turbidity, Adaption, Speciation, Environmental effects, Water pollution effects.
Identifiers: *Planarians, *Dugesia tigrina, *Polycelis felina, Comparative studies.

A closed-bottle method was used for determining the lethal level of oxygen for two fresh-water Triclads, Dugesia tigrina, and Polycelis felina, in stagnant as well as in stirred water. The lethal level was about 0.30 mg if dissolved oxygen per liter. However it varies significantly according to the species and to whether the water is stirred or not. At low oxygen concentrations, both species reduce considerably their metabolism, i.e. they adapt to the low oxygen levels. D. tigrina does so to a greater extent than P. felina. D. tigrina also survives 6 times longer than P. felina in such unfavorable conditions. (Katz)
W75-09675

**AVOIDANCE OF FENITROTHION BY GOLDFISH (CARASSIUS AURATUS),**
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
E. Scherer.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 4, p 492-496, April 1975. 1 fig, 1 tab, 6 ref.

Descriptors: *Fish behavior, *Pesticides, *Bioassay, Laboratory tests, Toxicants, Environmental effects, Water pollution effects, Toxicity, *Lethal limit, Pollutant identification.
Identifiers: *Sublethal effects, Carassius auratus, *Fenitrothion, *Avoidance(Fish), *Goldfish.

Goldfish (Carassius auratus) avoided water containing the pesticide fenitrothion. The response was graded over the tested concentration range of five orders of magnitude. The threshold was around 10 micro-grams per liter to 3.5 X 10-8M, which was well below the incipient lethal level. (Katz)
W75-09677

**THE EFFECTS OF OILS ON GROWTH OF FRESHWATER PHYTOPLANKTON,**
Polytechnic of Central London (England). Dept. of Life Sciences.
V. N. Dennington, J. J. George, and C. H. E. Wyborn.
Environmental Pollution, Vol 8, No 3, p 233-237, April 1975. 2 fig, 2 tab, 13 ref.

Descriptors: *Phytoplankton, *Euglena, *Scenedesmus, *Primary productivity, *Growth rates, *Oil pollution, Populations, Sampling, Photosynthesis, Food chains, Water pollution effects, Cultures, Metabolism.
Identifiers: Freshwater phytoplankton, *Euglena gracilis, *Scenedesmus quadricauda, Diesel oils, Lubricating oils.

Experiments investigating the effects of oils on pure cultures of freshwater algae show that Euglena gracilis grew in cultures containing up to 10% diesel and lubricating oils. The growth of Scenedesmus quadricauda was reduced by lubricating oil and halted by the presence of diesel oil. It was suggested that oils may affect photosynthetic metabolism in sensitive species. **EFFECTS OF PCB ON INTERSPECIFIC COMPETITION IN NATURAL AND GNOTOBIOTIC PHYTOPLANKTON COMMUNITIES IN CONTINUOUS AND BATCH CULTURES,**
State Univ. of New York, Stony Brook. Marine Biology Program.
N. S. Fischer, E. J. Carpenter, C. C. Remsen, and C. F. Wurster.
Microbial Ecology, Vol 1, No 1, p 39-50, 1974. 4 fig, 2 tab, 43 ref.

Descriptors: *Polychlorinated biphenyls, *Diatoms, Competition, *Algae, *Phytoplankton, Methodology, *Analytical techniques, Pesticides, Chlorinated hydrocarbon pesticides, Laboratory tests, Environmental effects, Primary productivity, Water pollution effects.
Identifiers: *Thalassiosira pseudonana, *Gnotobiotic communities.

The toxicity of PCBs to the diatom Thalassiosira pesudonana grown in pure and mixed cultures was greatest when in competition with other species. Continuous cultures were superior to batch cultures for studying competitive interaction, and PCB caused greater alteration of species composition in continuous cultures than in batch cultures. Normal phytoplankton communities, maintained in continuous culture, responded to PCB stress the same as did gnotobiotic communities, with T. pseudonana showing similar responses in both communities. A PCB concentration of 0.1 microgram g/l did not affect algal growth in pure cultures but caused substantial disruption of continuous culture communities. The possible impact of PCB pollution on natural phytoplankton communities is discussed. (Katz)
W75-09680

**EFFECT OF TEMPERATURE ON ACCUMULATION OF METHYLMERCURIC CHLORIDE AND P,P' DDT BY RAINBOW TROUT (SALMO GAIRDNERI),**
National Marine Fisheries Service, Ann Arbor, Mich. Great Lakes Fishery Lab.
R. E. Reinert, L. J. Stone, and W. A. Willford.
Journal of the Fisheries Research Board of Canada, Vol 31, No 10, p 1649-1652, October, 1974. 1 fig, 1 tab, 10 ref.

Descriptors: Temperature, *Heated water, *Rainbow trout, *Pesticide residues, *DDT, *Mercury, Laboratory tests, Bioassay, Analytical techniques, Methodology, Gas chromatography, DDE, Metabolism, Environmental effects, Water pollution effects, Thermal pollution, Water temperature.
Identifiers: Bioaccumulation, *Methylmercuric chloride.

Amounts of mercury and DDT residues accumulated from water by yearling rainbow trout in the laboratory increased as water temperature increased. Fish exposed to methylmercuric chloride at concentrations of 234-263 parts per trillion for 12 weeks at 5,10 and 15C accumulated 1.19, 1.71 and 1.96 ppm; fish exposed to DDT at concentrations of 133-176 parts per trillion accumulated 3.76, 5.93 and 6.82 ppm. Concentrations of mercury accumulated by the fish were significantly different at each of the three temperatures, and the concentrations of DDT were significantly different at 5, 10 and 15C. (Katz)
W75-09681

**POND SNAIL EGGS AS AN INDICATORY MATERIAL FOR WATER POLLUTION BIOASSAY: PRELIMINARY EXPERIMENTS, (IN JAPANESE),**
Doshisha Univ., Kyoto (Japan). Biological Lab.
N. Kobayashi.
The Japanese Journal of Limnology, Vol 35, No 4, p 155-161, October 1974. 2 fig, 4 tab, 11 ref. English abstract.

Descriptors: *Monitoring, *Bioassay, *Bioindicators, Water quality control, *Snails, *Inhibition water pollution effects, Pollutant identification, Water quality, Laboratory tests, Growth rates mercury, Cadmium, Copper, Zinc, Chromium, Lead, Metals, Polychlorinated biphenyls, *Pollutant identification.
Identifiers: *Radix auricularius japonicus, Japan(Osaka).

Bioassays were made to measure the water pollution around Osaka city using pond snail (Radix auricularius japonicus) eggs as an indicator organism. No cleavage of eggs occurred in the heavily polluted sewage disposal plant discharge. Heavy metals stop, retard or deform development, as do some other chemicals. The advantages of using pond snail eggs as a bioassay organism are simplicity, speed, high sensitivity, uniformity and accuracy. (Katz)
W75-09682

**USE OF SODIUM PENTACHLOROPHENATE AND DEHYDROABIETIC ACID AS REFERENCE TOXICANTS FOR SALMONID BIOASSAYS,**
Fisheries and Marine Service, West Vancouver (British Columbia). Pacific Environment Inst.
J. C. Davis, and R. A. W. Hoos.
Journal of the Fisheries Research Board of Canada, Vol 32, No 3, p 411-416, March 1975. 2 tab, 12 ref.

Descriptors: Toxicity, *Salmonids, *Bioassay, Standards, Laboratory tests, Rainbow trout, Trout, Salmon, *Toxicants, Lethal limit, Water temperature, Hardness(Water), Hydrogen ion concentration, Testing, Laboratory tests, Sockeye salmon, Pollutant identification.
Identifiers: *Sodium pentachlorophenate, Reference toxicants, *Dehydroabietic acid, Coho salmon, *Toxicity tests, Oncorhynchus ssp.

Results of an interlaboratory bioassay standardization exercise involving seven independent fish bioassay laboratories in British Columbia are presented. Toxicity of standard solutions of sodium pentachlorophenate and dehydroabietic acid was determined in freshwater static bioassays with yearling rainbow trout (Salmo gairdneri), coho salmon (Oncorhynchus kisutch) and sockeye (Oncorhynchus nerka) salmon. Reported LC50's for the three species ranged from 37 to 130 ppb for sodium pentachlorophenate and 1.03-2.14 ppm for dehydroabietic acid. In general, test results for individual species and toxicants were fairly consistent and major disparities could be explained in some instances by variations in physical and chemical characteristics of the bioassay such as water temperature, hardness or pH. Fish size and condition factor appeared to have little effect on apparent toxicity over the ranges tested. The usefulness of reference toxicants for standardizing bioassays is emphasized and suggestions are made for improved test procedures and increasing accuracy of results. Guidelines for toxicity tests should include the use of reference toxicants as a means of standardizing bioassay results. (Katz)

**EFFECT OF POWER PLANT CHLORINATION ON ESTUARINE PRODUCTIVITY,**
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
J. L. Fox, and M. S. Moyer.
Chesapeake Science, Vol 16, No 1, p 66-68, March 1975. 2 fig, 22 ref.

Descriptors: *Chlorination, *Water purification, *Cooling water, *Powerplants, Water treatment, Control, Primary productivity, Chlorine, *Water pollution effects, *Florida.
Identifiers: *Biological fouling, Crystal River powerplant(Fla).

Power plants chlorinate their cooling waters to prevent biological fouling of condenser tube walls. The effects of chlorine on in situ net primary productivity in the discharge waters of a power plant at Crystal River, Florida were examined. Primary productivity values decreased an average of 57% due to plant passage and chlorination. in the absence of chlorine, the average decrease was 13%. (Katz)
W75-09684

**EFFECTS OF LOGGING ON WATER TEMPERATURE AND DISSOLVED OXYGEN IN SPAWNING BEDS,**
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
N. H. Ringler, and J. D. Hall.
Transactions of the American Fisheries Society, Vol 104, No 1, p 111-121, 1975. 8 fig, 5 tab, 28 ref.

Descriptors: *Fish reproduction, *Water temperature, *Dissolved oxygen, *Spawning, *Lumbering, Streams, *Salmonids, Environmental effects, Salmon, Trout, Ecosystems, Sediments, Commercial fishing, Water quality, Temperature, Life cycles, Fry, Mortality, *Clearcutting, Water pollution effects.
Identifiers: *Coho salmon, Cutthroat trout, Intragravel water, Survival.

The temperature and dissolved oxygen content of intragravel water were measured in three Oregon coastal streams between June 1968 and June 1969. In 1966, the watershed of one stream had been completely clear-cut, and that of a second stream partially clearcut in staggered settings. A third watershed was left unlogged. Clearcut logging resulted in increased temperature of intragravel water in salmon and trout spawning beds and decreased concentrations of dissolved oxygen. The changes were related largely to reduced forest cover over the stream surface and to deposition of fine sediments in the gravel. No serious reduction in survival to emergence of coho salmon occurred along with the observed changes in temperature or dissolved oxygen. A decrease in the resident population of cutthroat trout after logging may have been related to these changes. (Katz)
W75-09685

**DDT AND THE RUGOPHILIC RESPONSE OF SETTLING BARNACLES BALANUS IMPROVISUS,**
North Carolina Univ., Morehead City. Inst. of Marine Sciences.
N. Meith-Avcin.
Journal of the Fisheries Research Board of Canada, Vol 31, No 12, p 1960-1963, December 1974, 4 fig, 1 tab, 5 ref.

Descriptors: *Crustaceans, *Organic pesticides, *DDT, Laboratory studies, Fish physiology, Water pollution effects.
Identifiers: Balanus improvisus, *Rugophilic response, *Barnacles, *Cyprids, Tactile discrimination, Glass settling plates.

Treatment of glass-settling plates with DDT generally resulted in lowered settlement densities of the cyprids of Balanus improvisus and lowered indices of preference for roughened surfaces, indicating that DDT interferes with the cyprids' rugophilic response pattern, particularly tactile discrimination, to settlement surfaces. (Katz)

**ACUTE TOXICITY OF NITRITE TO RAINBOW TROUT (SALMO GAIRDNERI),**
Montana State Univ., Bozeman. Fisheries Bioassay Lab.
R. C. Russo, C. E. Smith, and R. V. Thurston.
Journal of the Fisheries Research Board of Canada, Vol 31, No 10, p 1653-1655, October 1974. 1 fig, 1 tab, 10 ref.

Descriptors: *Trout, *Salmonids, *Bioassay, *Lethal limit, *Nitrites, *Toxicity, Water pollution sources, Sewage, Nitrification, Laboratory, studies, Fish physiology, Water pollution effects.
Identifiers: Bioaccumulation, *Methemoglobinemia, Tissue analysis.

Flow-through bioassays on the acute toxicity of nitrite to rainbow trout (Salmo gairdneri) of four different sizes (2-235g) showed median lethal concentration (LC50) values for 4 days ranging from 0.19 to 0.39 mg/liter NO2-N. For 12-g rainbow trout the asymptotic LC50 was 0.14-0.15 mg/liter NO2 after 8 days. Resulting methemoglobinemia due to the exposure of salmonids to nitrite was discussed. (Katz)

**THE EFFECTS OF LAPSED TIME SINCE FEEDING UPON THE TOXICITY OF ZINC TO FISH,**
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. Cairns, Jr., W. H. van der Schalie, and G. F. Westlake.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 3, p 269-274, March 1975. 1 fig, 2 tab, 5 ref.

Descriptors: *Bioassay, Methodology, *Laboratory tests, *Toxicity, *Zinc, *Time, *Toxicants, Mortality, Pollutants, Analytical techniques, Fish, Standards, Water pollution effects.
Identifiers: *Carassius auratus, Fishfeeding.

Fish bioassays advise a period of no feeding before exposing the fish to potential toxicants. The validity of this procedure was tested by determining the effects of different lapsed times between feeding and placement in a toxicant. Fish were placed in water containing a lethal concentration of zinc at specific times after feeding from 0-72 hours. Time until death was recorded for each fish. Statistical analysis revealed a slight increase in survival time as the interval between feeding and exposure to zinc increased. This did not appear to be of sufficient magnitude to support the standard acute bioassay requirement that fish not be fed for 24-48 hours prior to their exposure to a toxicant. (Katz)
W75-09688

**DDT RESIDUES IN EUPHAUSIIDS IN THE UPPER ESTUARY OF THE GULF OF ST. LAWRENCE,**
Bedford Inst., Dartmouth (Nova Scotia).
D. C. Darrow, S. Guildford, and D. D. Sameoto.
Journal of the Fisheries Research Board of Canada, Vol 32, No 2, p 310-314, February 1975.

Descriptors: *DDT, *Chlorinated hydrocarbon pesticides, *Zooplankton, Aquatic populations, *Food chains, *Primary productivity, Analytical techniques, Equations, Lipids, *Pesticide residues.
Identifiers: *Euphausiids, Thysanoessa raschii, Thysanoessa inermis, Meganyctiphanes norvegica, *Gulf of St. Lawrence.

No significant variation was found in organochlorine residue levels between different stations in an area from the Saguenay River to the end of the Gaspe' Peninsula in the Gulf of St. Lawrence for the euphausiids Thysanoessa raschii, T. inermis and Meganyctiphanes norvegica. Significant differences were found between the concentration of organochlorine residues for M. norvegica and the Thysanoessa species, but there was no difference between the two Thysanoessa species. Significantly lower values for percent lipid were found in T. inermis and T. raschii between June 1973 and May 1974 samples, but the total amount of organochlorine residues did not change. This suggests that these species do not lose p,p'-DDT when they metabolize lipids for energy or the production of gonad material. (Katz)

**UPTAKE, METABOLISM AND DISTRIBUTION OF DDT IN ORGANS OF THE BLUE CRAB, CALLINECTES SAPIDUS,**
Virginia Inst. of Marine Science, Gloucester Point.
P. F. Sheridan.
Chesapeake Science, Vol 16, No 1, p 20-26, March 1975. 3 tab, 41 ref.

Descriptors: *DDT, DDE, DDD, *Pesticide residues, *Bioassay, *Crabs, Commercial shellfish, *Chlorinated hydrocarbon pesticides, *Metabolism, *Virginia, *Absorption, Distribution, Water pollution effects.
Identifiers: Tissue analysis, Hepatopancreas, Gonads, *Bioaccumulation, Callinectes sapidus, *York River(Virginia).

Metabolites of DDT were detected in five out of six major organs of adult blue crabs collected from the York River, Virginia during the summer of 1972. Total residue concentrations were highest in the hepatopancreas (55-217 ppb) and below the limit of detection in the heart and associated serum. Concentrations in pooled gonad samples (ovaries and testes) were variable (9-67 ppb) and correlated with the development stage of the ovaries. Residue levels were low in the gills (6-31 ppb), backfin muscles and edible claw (1-13 ppb). DDT itself was not detected in any of the organs. Adult blue crabs were exposed for 12 hours to 0.01, 0.1 and 1.0 ppm DDT in water and monitored with respect to metabolism and distribution of residues. Metabolic transformation of DDT to DDD and DDE occurred immediately, regulated by the hepatopancreas. (Katz)
W75-09691

**DEPOSITION OF ZINC AND CADMIUM BY MARINE BACTERIA IN ESTUARINE SEDIMENTS,**
Geological Survey, Corpus Christi, Tex.
C. W. Holmes, and C. J. McLerran.
Limnology and Oceanography, Vol 19, No 3, p 998-1001, 1974. 2 fig, 8 ref.

Descriptors: *Texas, Bacteria, *Aquatic bacteria, *Estuaries, *Heavy metals, Translocation, *Zinc, *Cadmium, *Sediments, *Radioactive isotopes, Growth cycles, Populations, Cultures, Metabolism, Growth rates, Environmental effects, Laboratory tests, Water pollution effects.
Identifiers: Bioaccumulation, Corpus Christi Harbor(Tex).

Mixed cultures of marine bacteria isolated from the sediments of Corpus Christi Harbor, Texas, were examined for their ability to assimilate or precipitate radioactive zinc and cadmium from solution. Test data indicate that during summer, when bacterial activity is at a maximum, the bacteria and their metabolic byproducts play a significant role in the removal of zinc and cadmium from seawater and their subsequent deposition [illegible] marine sediments. (Katz)
W75-09692

**EFFECT OF ZINC ON GROWTH OF THE MI[illegible] NOW PHOXINUS PHOXINUS,**
Umea Univ (Sweden) Dept. of Biology
B. E. Bengtsson
Oikos, Vol 25, No 1, p 370-373, 1974. 2 fig, 2 t[illegible] 15 ref

Descriptors: Freshwater fish, *Bioassay, *Growth rates, *Growth stages, *Fish physiolog[illegible] *Nitrates, Environmental effects, Biochemistr[illegible] Laboratory studies, Water pollution effect[illegible] Metabolism, Pesticides, *Zinc.
Identifiers: *Phoxinus phoxinus, *Minnows, *Zi[illegible] nitrate, Bioaccumulation, Tubifex, Comparati[illegible] studies, Sublethal dosages.

Reduced growth occurred in yearlings and adul[illegible] of the minnow Phoxinus phoxinus following exp[illegible] sure to zinc nitrate in fresh water over a 150-da[illegible] period. Yearlings were more sensitive than adul[illegible] and showed reduced growth at 0.13 ppm zin[illegible] (corresponding to 1/25 of the 96-hr. LC50[illegible] Supressed growth was associated with reduce[illegible] Tubifex consumption. Both yearlings and adult[illegible] showed a pronounced initial response. (Katz)

**CHANGES IN BLOOD CHEMISTRY OF JU[illegible] VENILE STEELHEAD TROUT, SALMO GAIRD[illegible] NERI, FOLLOWING SUBLETHAL EXPOSURE[illegible] TO NITROGEN SUPERSATURATION,**
National Marine Fisheries Service, Seattle, Wash.
T. W. Newcomb.
Journal of the Fisheries Research Board of Canada, Vol 31, No 12, p 1953-1957, December 1974. 1 fig, 28 ref.

Descriptors: *Salmonids, *Trout, *Nitrogen, *Argon, *Tissue analysis, *Fish physiology, *Chemical analysis, Environmental effects, Laboratory tests, Dissolved oxygen, Stress, Water pollution effects.
Identifiers: *Blood chemistry, *Swimming performance, Sublethal saturation, Gas embolism.

Groups of juvenile steelhead trout (Salmo gairdneri) were exposed for 35 days to various (103, 105, 110 and 116%) sublethal nitrogen plus argon saturations. Pooled serum samples were analyzed for Ca, Na, PO4, K, Cl, albumin, total protein, cholesterol, alkaline phosphatase, glucose, urea, uric acid, total biblirubin, lactate dehydrogenase, and serum glutamic oxalacetic transaminase. An increase in serum potassium and phosphate, and a decline in serum albumin, calcium, cholesterol, total protein and alkaline phosphatase were noted in steelhead exposed to 116% nitrogen (N2+Ar) saturation (total atmospheric gas saturation 110%). No major changes in blood chemistry were observed at nitrogen saturations of 110% or less. (Katz)
W75-09694

**THE EFFECT OF CONCENTRATION OF SUSPENSION AND INERT MATERIAL ON THE ASSIMILATION OF ALGAE BY THREE BIVALVES,**
Newcastle-upon-Tyne Univ. (England). Dove Marine Lab.
R. L. Foster-Smith.
Journal of the Marine Biological Association of the United Kingdom, Vol 55, p 411-418, 1975. 4 fig, 4 tab, 7 ref.

Descriptors: *Suspended solids, *Crustaceans, *Selectivity, *Filtration, Suspension, Mussel, Laboratory tests, Algae, Feeding rates, Analytical techniques, Water pollution effects.
Identifiers: Mytilus edulis, Cerastoderma edule, Venerupis pullastra, Pallial organs, Assimilation efficiency, Gills.

The effect of concentration of food in suspension on assimilation efficiences was investigated using Mytilus edulis, Cerastoderma edule, and Venerupis pullastra. Assimilation efficiency was inversely related to the total amounts of Phaeodactylum ingested over periods of up to 3 h rather than related directly to concentration of suspension or rates of ingestion. The pallial organs did not select Phaeodactylum in preference to inorganic particles (alumina), but once ingested the alumina had little effect on the proportion of Phaeodactylum ingested. (Katz)
W75-09695

**THE ACCUMULATION OF FLUORIDE BY MARINE AND INTERTIDAL ANIMALS,**
Newcastle-upon-Tyne Univ. (England). Dept. of Plant Biology.
D. A. Wright, and A. W. Davison.
Environmental Pollution, Vol 8, No 1, p 1-13, January 1975. 1 fig, 9 tab, 22 ref.

Descriptors: *Toxicity, *Aluminum, *Industrial wastes, Invertebrates, *Bioassay, *Marine animals, Intertidal areas, Mollusks, Mussels, Baseline studies, Public health, Estuaries, Fluorides.
Identifiers: *Bioaccumulation, *Mytilus edulis.

Preliminary toxicity tests with fluoride were carried out on a number of marine invertebrates. Evan at unnaturally high ambient fluoride levels, no adverse effects were seen, except possibly in the case of the filter-feeding mollusc Mytilus edulis. In both invertebrates and vertebrates, fluoride was accumulated in skeletal structures. There was little or no accumulation in soft, edible tissues, with the exception of fish skin. (Katz)
W75-09697

**EFFECTS OF THIOUREA TREATMENT ON SEXUALLY MATURING AND GONADECTOMIZED MALE SOCKEYE SALMON (ONCORHYNCHUS NERKA),**
Fisheries and Marine Service, Vancouver (British Columbia). Vancouver Lab.
J. R. McBride, and A. P. Overbeeke.
Journal of the Fisheries Research Board of Canada, Vol 32, No 1, p 11-19, January 1975. 4 fig, 1 tab, 26 ref.

Descriptors: *Sockeye salmon, *Growth stages, *Gonads, *Bioassay, *Fish physiology, Biochemistry, Sexual maturity, Salmonids, Laboratory tests, Water pollution effects.
Identifiers: *Thyroid, *Pituitary gland, Cell types, *Tissue analysis, Gonadectomized fish, *Thiourea, Thyrotrops, Negative feedback, PAS-positive cells, Mycoid cells.

Adult male sockeye salmon (Oncorhynchus nerka) in the final stage of sexual maturation were treated with thiourea for periods of 7-14 weeks which produced strong histological thyroid stimulation but no visible effect on spermatogenesis or development of secondary sexual characteristics. Thiourea inhibited the increase in thickness of the skin and induced changes in the pars distalis of the pituitary gland, involving several cell types, including retardation of gonadotrop development. In gonadectomized fish, thiourea affected neither the skin nor the interrenal tissue. It caused a marked increase in the height of the thyroid epithelium correlated with hypertrophy, degranulation, and some vacuolization of PAS-positive cells in the dorso-caudal area of the proximal pars distalis of the pituitary gland. (Katz)
W75-09699

**BEHAVIOR OF JUVENILE COHO SALMON (ONCORHYNCHUS KISUTCH) EXPOSED TO SUMITHION (FENITROTHION), AN ORGANOPHOSPHATE INSECTICIDE,**
British Columbia Dept. of Recreation and Conservation, Victoria. Fish and Wildlife Branch.
C. J. Bull, and J. E. McInerney.
Journal of the Fisheries Research Board of Canada, Vol 31, No 12, p 1867-1872, December 1974. 2 fig, 22 ref.

Descriptors: *Salmon, *Organophosphorus pesticides, *Insecticides, *Fish behavior, *Bioassay, *Fish physiology, *Salmonids, *Water pollution effects, Laboratory tests, Environmental effects.
Identifiers: Oncorhynchus kisutch, *Coho salmon, *Sumithion, Locomotion, Comfort behavior.

Coho salmon, Oncorhynchus kisutch, were exposed to sublethal concentrations of the organophosphate pesticide Sumithion. After 2-hr exposure at 0.48 and 0.75 ppm, behavior involving locomotion ceased, except coughing which increased. In the 0-0.23 ppm range social behavior and feeding decreased. Feeding was depressed at concentrations as low as 0.1 ppm. (Katz)
W75-09700

**EFFECT OF CONSTANT TEMPERATURE ON GROWTH RATES OF PUMPKINSEED SUNFISH (LEPOMIS GIBBOSUS),**
Queen's Univ., Kingston (Ontario). Dept. of Zoology.
E. Pessah, and P. M. Powles.
Journal of the Fisheries Research Board of Canada, Vol 31, No 10, p 1678-1682, October 1974. 4 fig, 1 tab, 13 ref.

Descriptors: *Sunfishes, *Growth rates, *Water temperature, Bioassay, Thermal pollution, Aquiculture, Laboratory studies, Environmental effects, Growth stages, Fish physiology, Metabolism, Thermal pollution, Water pollution effects.
Identifiers: *Pumpkinseed sunfish, Lepomis gibbosus, *Growth acclimation, Growth model.

Relative growth rates of fall-captured Lepomis gibbosus exposed to six constant temperature regimes (5-30C) were clearly separable for the first six weeks. Thereafter, growth declined, becoming uniform between 15 and 30C, and linear and negative at 10 and 5C, respectively. A growth model between 15 and 30C, emerged as follows: 0-4 wk, rapid; 5-10 wk, intermediate; 11-16 wk, low uniform. The initial high followed by the low uniform stanza suggests 'growth acclimation' took place. (Katz)

**ORGANOCHLORINE RESIDUE LEVELS IN ARCTIC RINGED SEALS: VARIATION WITH AGE AND SEX,**
Bedford Inst., Dartmouth (Nova Scotia).
R. F. Addison, and T. G. Smith.
Oikos, Vol 25, No 3, p 335-377, 1974. 2 tab, 8 ref.

Descriptors: *Pesticide residues, *DDT, *Lipids, *DDE, *Polychlorinated biphenyls, Chlorinated hydrocarbon pesticides, Pesticides, Aging(Biological), Path of pollutants, Mammals, Age, Water pollutant effects.
Identifiers: *Arctic ringed seals, Tissue analysis, Bioaccumulation, Sex.

Residues of DDT, DDE and PCB's were found in blubber samples of Canadian Arctic ringed seals Pusa hispida at concentrations in the low ppm range. In males, residue concentration increased with age, slopes of the curves relating DDE and DDT to age differed significantly ($P<0.01$) from zero, but the relationship between PCB and age was weaker ($P<0.05$). In females, these relationships were absent. (Katz)
W75-09702

**EFFECTS OF METAL-MINE DRAINAGE ON WATER QUALITY IN SELECTED AREAS OF COLORADO, 1972-73,**
Geological Survey, Denver, Colo.
R. E. Moran, and D. A. Wentz.
Colorado Water Resources Circular No 25, 1974. 250 p, 31 fig, 22 tab, 55 ref, append. Published by Colorado Water Conservation Board, Denver.

Descriptors: *Path of pollutants, *Water pollution sources, *Mine drainage, *Mine wastes, *Colorado, Acid mine water, Mine water, Mining, Spoil banks, Waste dumps, Water pollution effects, Water quality, Water chemistry.

In 18 mining areas in Colorado, significant amounts of acidity and metals are added to surface waters by drainage from mines and associated tailings. In the vicinity of Kerber Creek, acid drainage from an abandoned adit flows through a tailings pile and then into the stream; metal contributions from the tailings are greater than those from the adit. Stream pH's increase below the drainage due to dilution and neutralization of the acid by bicarbonate. Dissolved metal concentrations decrease due to dilution, chemical precipitation, and probably adsorption onto ferric hydroxide particles. Total metal concentrations in streams of the Kerber Creek area decrease downstream due to dilution and to settling of the precipitates. Manganese and zinc remain predominantly in the dissolved phase: when they do precipitate they settle out rapidly. Cadmium, copper, iron, lead, and nickel gradually shift from the dissolved to the suspended fraction, indicating a different removal process. Both total and dissolved metal loads in streams of the Kerber Creek area are greater during high flow than during low flow, owing to flushing of water from mines and tailings piles, erosion of tailings, and scouring of chemical precipitates from the stream bottom. (Knapp-USGS)

**EVALUATION OF ENVIRONMENTAL IMPACT OF LANDFILLS,**
Wisconsin Univ., Madison.
P. Caffrey, M. David, and R. K. Ham.
Journal of the Environmental Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No EE1, Paper 11119, p 55-69, February 1975. 1 fig, 4 tab, 1 append. NSF Grant GI-29731.

Descriptors: *Landfills, *On-site investigations, *Waste dumps, *Wisconsin, Land management, Waste disposal, Evaluation, Environmental effects, Water quality, Aesthetics, Environmental engineering, Inspection, Water pollution effects.
Identifiers: *Environmental impact, Noise, Vectors, Air quality.

In order to evaluate various refuse recycling and disposal alternatives, it was necessary to evaluate the environmental impact of present disposal methods (landfill). The method used involves evaluating ratings for 20 field factors to determine the effect on six basic environmental parameters. This procedure was used to evaluate 69 sites in Wisconsin. The results showed that land use and esthetics were affected most by landfills, followed by air and water quality with lesser effects on noise and vectors. Further analysis compared average ratings for various types of land disposal sites and showed that city and county sites had less environmental impact than town or village sites and that sanitary sites performed better than open dumps. (Lardner-ISWS)

**PICK UP AND METABOLISM OF DDT, DIELDRIN AND PHOTODIELDRIN BY A FRESHWATER ALGA (ANKISTRODESMUS AMALLOIDES) AND A MICROCRUSTACEAN (DAPHNTA PULEX),**
Illinois Univ., Chicago. Dept. of Biological Sciences.
S. Neudorf, and M. A. Q. Khan.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 4, p 443-450, April 1975. 2 fig, 3 tab, 27 ref.

Descriptors: *DDT, *DDD, *Pesticides, *Absorption, Adsorption, *Metabolism, *Algae, *Daphnia, *Dieldrin, *Bioassay, DDE, Aquatic

animals, Crustaceans, Water fleas, Carbon radioisotopes, Chlorinated hydrocarbon pesticides, Insecticides, Laboratory tests, Food chains, Water pollution effects.
Identifiers: *Photodieldrin, Bioaccumulation, *Ankistrodesmus amalloides, Daphnia pulex.

The uptake and metabolism of DDT, dieldrin and photodieldrin in a fresh water food chain was investigated with the use of 14C-labeled pesticides. The fresh water alga, Ankistrodesmus amalloides, concentrated 2.5 times more DDT than dieldrin and ten times more DDT than photodieldrin. This was attributed to the solubilities of the pesticides. The time for maximum absorption was 120 minutes for DDT, 30-60 minutes for dieldrin and 30 minutes for photodieldrin. The alga metabolized DDT to both DDE (3.5%) and DDD (0.8%). The fresh water flea, Daphnia pulex, shows a 13.6% conversion of DDT to DDE. (Katz)

**AQUATIC INSECT COMMUNITIES OF THE TENRYU RIVER, THEIR COMPOSITION, BIOTIC INDEX AND SEASONAL CHANGE, (IN JAPANESE),**
Suzaka High School (Japan).
T. Komatsu.
The Japanese Journal of Limnology, Vol 35, No 4, p 173-184, October 1974. 12 fig, 2 tab, 16 ref. (English abstract).

Descriptors: *Biological communities, *Aquatic insects, *Insect behavior, *Biorhythms, *Water pollution, Speciation, Waste water, Water quality, Industrial wastes, Seasonal, Microenvironment, Data collections, Stations.
Identifiers: *Biotic index, Tenryu River(Japan), *Japan.

During the year 1968-1969 the seasonal change of aquatic insect communities and the biotic index were studied in the Tenryu River, Central Japan, including an area which had been polluted by pulp plant wastes. Number of species was found to range from 2 to 29. Maximum numbers were attained in May, and minimum in July in relatively clean water. The net-spinning caddis-worm Hydropsche ulmeri predominated the area. (Katz)

**DIVERSITY OF MARINE INVERTEBRATES IN A THERMAL EFFLUENT,**
Delaware Univ., Lewes. Coll. of Marine Studies.
D. T. Logan, and D. Maurer.
Journal Water Pollution Control Federation, Vol 47, No 3, p 515-523, March 1975. 2 fig, 5 tab, 31 ref.

Descriptors: *Heated water, *Invertebrates, *Biological communities, *Benthos, *Temperature, *Environmental effects, Analytical techniques, *Thermal pollution, Water pollution effects, Effluents, Water quality control, Bioindicators, Pollutants, Marine animals.
Identifiers: *Diversity index, Thermal effluents.

In order to test the hypothesis that species diversity may be used to determine the effect of a pollutant on a community, the effect of a thermal effluent on an estuarine benthic community was recorded. Data showed that an unusually high diversity may exist in a thermal effluent at the mouth of the discharge canal. Differences in species composition, an increase in relative numbers of a pollution indicator organism, and reduction in species number and the total number of organisms in the effluent were noted. This change in community structure was not necessarily reflected by a decrease in diversity. It is premature to rely exclusively on a diversity index when one is evaluating the effect of a pollutant on a community. (Katz)

## 5D. Waste Treatment Processes

**TREATMENT AND SAFE DISPOSAL OF CATIONIC COATING COLORS,**
Merck and Co., Pittsburgh, Pa.
R. H. Windhager.
Preprint, Canadian Pulp and Paper Association, Annual Meeting (Montreal), 1975, p A161-165, 3 fig, 5 ref, 3 tab.

Descriptors: *Pulp wastes, *Cations, *Waste water treatment, *Neutralization, Industrial wastes, Wastes, Waste treatment, Clays, Toxicity, Fish, Water pollution sources, Pollutants, Colorimetry, Analytical techniques, Water pollution treatment, Colorimetry, Polymers, *Waste disposal.
Identifiers: Hydroxyethyl starch, Polyacrylamide, Lignosulfonates, Black liquor, Coating colors, Broke, Repulping, Reprographic papers, Coated papers, Dielectric papers, Electrophotographic papers.

Strongly cationic coating colors are widely used in the manufacture of conductive substrates for Electrofax, dielectric, and other reprographic papers. The long-chain quaternary ammonium polymers give the best conductive response over a wide relative humidity range, and are the products of choice for these applications. Methods of neutralizing cationic coating color wastes with clays, hydroxyethylated starch, polyacrylamide, lignosulfonate derivatives, and kraft black liquor are discussed. Unless these wastes are properly inactivated before discharge into a body of water, they can have a toxic effect on fish life. Two colorimetric tests for detecting non-neutralized cationic polymers in aqueous media are presented. In addition, the optimum repulping conditions for safe reuse of broke coated with cationic polymers are given. (Witt-IPC)

**RECYCLING A SOLID WASTE FROM A PAPER PLANT -- SEPARATION OF WOOD FIBER FROM CLAY BY DIFFERENTIAL FLOCCULATION,**
British Columbia Univ., Vancouver. Dept. of Mineral Engineering.
S. R. Rao, and A. A. Winer.
Preprint, Canadian Pulp and Paper Association, Annual Meeting (Montreal), 1975, p B25-30, 7 fig, 6 ref, 3 tab.

Descriptors: *Pulp wastes, *Fibers(Plant), *Clays, *Separation techniques, Flocculation, Cationic adsorption, Water pollution sources, Industrial wastes, Waste treatment, Solid wastes, Sludge, *Recycling, Pollution abatement, Sludge treatment, Water reuse.
Identifiers: Polyacrylamide.

A sludge sample obtained from a fine paper mill was separated into its wood fiber and clay components by flocculation. The best separation was made by means of a differential flocculation technique at pH 8, using a cationic flocculant (a polyacrylamide of low molecular weight). The best products obtained were 81% wood fiber and 19% adhering clay in the flocculated portion, and 78% clay and 22% wood fiber in the unflocculated portion. (Sykes-IPC)

**BIOLOGICAL TREATMENT OF SPENT BISULFITE LIQUOR (TRAITEMENT BIOLOGIQUE DE LA LIQUEUR RESIDUELLE AU BISULFITE),**
S. N. Los, J.-J. Garceau, and G. Pineault.
ATIP (Association Technique de l'Industrie Papetiere) Revue, Vol 29, No 2, p 55-60, 1975. 7 fig, 10 ref, 3 tab.

Descriptors: *Biological treatment, *Pulp wastes, *Sulfite liquors, *Waste water treatment, Wastes, Industrial wastes, Water pollution sources, Activated sludge, Biochemical oxygen demand, Oxygen requirements, Microorganisms, Carbohydrates, Laboratory tests, Water pollution treatment, Water pollution control, Lignins.
Identifiers: Lignosulfonates, High-yield pulping, Sodium bisulfite.

A laboratory study was made of biological treatment of spent liquor from high-yield sodium bisulfite pulping of wood using a conventional activated sludge system with four continuously operating 10-liter cells arranged in parallel. Data were obtained on levels of BOD removal, production of activated sludge, oxygen consumption, reaction rate, and feed-rate:microorganism, BOD:carbohydrate, and BOD:lignosulfonate ratios. Parameters studied included incoming liquor and sludge concentrations and residence time. BOD reduction ranged from 70-77% for the 4 cells. Oxygen consumption was 0.11 mg oxygen per mg of 5-day BOD removed. The results should be of use in designing an industrial-scale system. (Speckhard-IPC)
W75-09355

**WASTE WATER CLARIFICATION BY FLOTATION (FLOTACIOS SZENNYVIZTISZTITAS),**
K. Engelhoffer.
Papiripar, Vol 18, No 5, p 254-262, 1974. 12 fig.

Descriptors: *Pulp wastes, *Flotation, Water pollution treatment, Water pollution, Water purification, Water pollution sources, Industrial wastes, Wastes, *Waste water treatment, Technology, Economics, Recycling, Pulp and paper industry.
Identifiers: *White water, *Fiber recovery.

White water clarification and fiber recovery by flotation is gaining in importance over traditional sedimentation methods. Technological and economic advantages of flotation are indicated. High-pressure flotation has been used successfully at 4 paper mills both for treating of recycleable water and as final effluent purification. (Brown-IPC)

**USE OF CENTRIFUGES FOR PURIFICATION OF EFFLUENTS (PRIMENENIE TSENTRIFUG DLYA OCHISTKI STOCHNYKH VOD),**
Vyskumny Ustav Papieru a Celulozy, Prague (Czechoslovakia).
J. Trca, and J. Kirchnerova.

Bumaznnaya Promyshlennost, No 2, p 30-31, February, 1975.

Descriptors: *Centrifugation, *Suspended solids, *Dewatering, *Sludge treatment, *Water purification, Foreign research, Foreign countries, Europe, Water pollution treatment, Water pollution control, *Waste water treatment, Efficiencies, Costs, Wood wastes, Water pollution sources, Bark, Pilot plants, Treatment facilities, Sludge, Equipment.
Identifiers: Czechoslovakia.

Pilot plant experiments conducted in Czechoslovakia are described in which centrifuges were used for the removal of suspended solids from effluents and for dewatering muds from biological purification. The best type of centrifuge for this purpose is a continuous apparatus with a screw type discharge of the sediment. It has been reported in the literature that the main drawback of centrifuges is a worsening of the efficiency of purification equipment where the centrifuge filtrate is recycled. This was not observed in the experiments conducted. Also the reported higher costs of centrifugation as compared with filtration were not confirmed. The costs were actually lower. With the use of coagulating agents a dryness of up to 42% can be obtained for sedimentation muds. At present continuous centrifuges with screw discharge are being tested at biological purification plants for dewatering of excess activated sludge and muds formed during purification of effluents from wood barking. The procedure used in the second case is described. It is pointed out that a wider application of this type of purification depends on the development and production of more efficient new centrifuges. (Stapinski-IPC)

**OPTIMUM CONDITIONS FOR CHEMICAL PURIFICATION OF EFFLUENTS (OPTIMAL'NYE USLOVIYA KHIMICHESKOI OCHISTKI STOCHNYKH VOD),**
M. B. Berov, V. M. Shapchenko, and V. V. Lobko.
Bumazhnaya Promyshlennost, No 2, p 17-19, February, 1975. 5 fig.

Descriptors: *Pulp wastes, *Waste water treatment, Industrial wastes, Wastes, Water pollution treatment, Color, Lignin, Hydrogen ion cencentration, Neutralization, Chemical reactions, Water pollution sources, Water pollution, Biological treatment, Lime.
Identifiers: *Aluminum sulfate, Kraft mills, Sodium hydroxide, *Chemical treatment.

Chemical purification of kraft mill effluents, which have been purified biologically, is done by treatment with aluminum sulfate. The best results from the viewpoint of decoloration, lignin separation, and minimum residual aluminum are obtained at a pH of 5.5-5.8. Following decoloration and sedimentation, the purified effluent is neutralized with NaOH or lime to raise the pH to 6.5-7.5, a level required for the effluent discharge. A study of the purification system at a kraft mill showed that the pH of the effluent-aluminum sulfate mixture does not remain stable but increases steadily, although very slowly. The value of the final pH depends linearly on the initial pH; at an initial pH of 5.8 the final pH is 6.2-7.1. This steady increase of the pH is explained by the reaction of H ions with the dissociated (sodium form) hydroxyl groups of lignin. Because of the slowness of the process, the pH reached during the residence time of the effluent in the decoloration-sedimentation zone is not the equilibrium pH. However, it is high enough to eliminate the need for neutralization, provided the initial pH is sufficiently high i.e., not lower than 5.8. This will make it possible to eliminate the neutralization stage, thus reducing the mineralization of the purified effluent. (Stapinski-IPC)

**POSSIBILITIES FOR REDUCING 5-DAY BOD-CONSUMING MATERIALS IN STEAM CONDENSATES FROM SPENT SULFITE LIQUOR EVAPORATION (MOEGLICHKEITEN DER REDUKTION DER BSB(5)-VERBRAUCHENDEN STOFFE IN BRUNDENKONDENSATEN AUS SULFITABLAUGENEINDAMPFUNGEN),**
R. Hornke, and W. Kunstner.
Wochenblatt fur Papierfabrikation, Vol 103, No 6, p 195-199, March 31, 1975. 5 fig, 7 tab.

Descriptors: *Biochemical oxygen demand, *Sulfite liquors, *Evaporation, Water pollution sources, Water pollution control, Industrial wastes, Wastes, Pulp wastes, Biological treatment, Neutralization, Foreign countries, Europe, Water pollution treatment, Waste water treatment, Water quality control, Water pollution.
Identifiers: *Steam condensates, Sulfite mills, *Austria.

Significant amounts of oxygen-consuming substances are present in the acid steam condensate from sulfite mills. This tends to lower the quality of water streams which are usually rendered polysaprobic (very strongly polluted) by pulp mill discharges. By neutralization and biological treatment of the steam condensate before disposal, it was possible to improve stream quality considerably, from 180 5-day BOD (tons/day) to 5.5 at the Chemiefaser Lenzing mill in Austria. (Ward-IPC)

Available from IPC, Appleton, Wis 54911, for $8.00 in paper copy. English translation of Das Papier, Vol 29, No 3, p 100-104, March 1975. 4 fig, 7 ref, 2 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Recirculated water, *Water treatment, Industrial wastes, Industrial water, Water pollution sources, Water pollution treatment, Flocculation, Filtration, Absorption, Water pollution control, Legislation, Pulp and paper industry, Recycling.

The regulations governing effluent wastes have become more stringent, requiring corresponding changes in the paper and board industry. Chemical-physical effluent treatment processes are discussed. On the basis of theoretical considerations, test results, and mill experience, three are usable in recycling water, viz., flocculation, filtration, and adsorption. Suitably combined with a biological process, these offer solutions to the water pollution problem. (Ward-IPC)

**PACKED-BED REACTORS FOR SECONDARY EFFLUENT BOD AND AMMONIA REMOVAL,**
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. C. Young, E. R. Baumann, and D. J. Wall.
Journal Water Pollution Control Federation, Vol 47, No 1, p 46-56, January, 1975. 13 fig, 1 tab, 11 ref.

Descriptors: *Waste water treatment, Pilot plants, Suspended solids, Nitrification, Sewage treatment, Reviews, Biochemical oxygen demand, Ammonia.
Identifiers: *Packed-bed reactors, *BOD removal, *Ammonia removal.

The use of packed-bed reactors (PBRs) in waste water treatment is reviewed. Results of pilot plant studies are described from investigations conducted: to determine BOD and suspended solids removal characteristics of the PBR-filter system when it is used to polish secondary effluent from biological treatment plants; to determine whether nitrification may be accomplished in PBR units at temperatures below 10 C; to compare the performance and operating characteristics of various PBR media; and, to determine such characteristics of dual-media filters following aerobic PBR treatment of secondary effluents. The PBR and dual-media filter systems provided a high degree of polishing for low-quality secondary effluents. Effluent BOD was reduced to below 5 mg/liter. Nitrification was successful throughout cold weather for an entire winter operation. Effluent ammonia nitrogen concentrations averaged less than one mg/liter. Three PBR media--sand, crushed coal, and loosely-packed plastic--gave almost the same BOD and suspended solids removals. Selection of media thus should be related more to design and operational simplicity and cost than to media size and shape. Operation of packed-bed reactors is relatively simple in comparison with operation of activated sludge systems. (Prague-FIRL)

**FERRIC CHLORINE OR LIME FOR CHEMICAL TREATMENT,**
Technion Israel Inst. of Tech., Haifa. Environmental Engineering Labs.
N. Narkis, M. Rebhun, and R. Offer.
Water and Sewage Works, Vol 122, No 1, p 43-45, January, 1975. 2 fig, 3 tab, 8 ref.

Descriptors: *Lime, *Ferric chloride, Alum, *Sewage treatment, Flocculants, Costs, Sludge treatment, Waste disposal, Organic compounds, *Waste water treatment.

Identifiers: *Chemical treatment.

Direct chemical treatment of raw sewage, as primary treatment, followed by biological or physicochemical treatment has been studied. Chemical flocculation with ferric chloride is compared with lime flocculation according to the parameters: removal characteristics of mineral constituents, including alkalinity, phosphates and Mg++, and efficiencies of removal of sewage organic materials. Selection of the right flocculant is important in waste water treatment. Conventionally, ferric salts, alum, or lime are used. Ferric and aluminum salts act as flocculants through their positively charged polynuclear hydroxo complexes; lime treatment with a high pH causes the formation of positively charged Mg(OH)2, and CaCO3 precipitate. Hydrolyzing flocculants, such as ferric chloride, were compared with lime depending on: contaminants removal efficiencies by flocculation; water quality of the final effluent; economic feasibility; and, ultimate disposal of sludge. The choice of a flocculant is affected by costs and sludge handling. Lime requirements are higher than ferric salts or alum. Primary sludge from alum or iron can be treated anaerobically while lime sludge must be disposed by thickening, followed by filtration, drying and incineration or by acid dissolving. (Prague-FIRL)

**FLOW EQUALIZATION.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Seminar Publication, May, 1974. 21 p, 7 fig, 2 tab, 11 ref.

Descriptors: *Waste water treatment, *Municipal wastes, Equalization reservoirs, Flow control, Organic loading, Sewage treatment, Treatment facilities, *Reviews.
Identifiers: *Flow equalization.

The main objectives of flow equalization basins for municipal waste water treatment plants are to dampen the diurnal flow variation and the concentration and mass flow of waste water constituents. The result is a more uniform loading of organics, nutrients, and other suspended and dissolved constituents to subsequent processes, thus, flow equalization improves the performance of an existing treatment facility and/or reduces the required size of downstream facilities. Equalization of municipal waste water flows can be divided into three categories: equalization of dry weather flows; equalization of wet weather flows from separate sanitary sewers; and, equalization of combined storm and sanitary waste water. Dry weather flow equalization is discussed. The benefits of dry weather flow equalization including the impact on primary settling and on biological treatment are given. The determination of equalization requirements in terms of the determination of required volume, impact of equalization diurnal concentration variation, basin construction, air and mixing requirements, and pump and pump control systems is discussed. The costs of flow equalization vary considerably from one application to another, depending on the basin size, construction, mixing and aeration requirements, availability of land, location of facility, and pumping requirements. Several case histories of flow equalization are presented. (Orr-FIRL)
W75-09381

**NITRIFICATION AND DENITRIFICATION FACILITIES, WASTEWATER TREATMENT.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Seminar Publication, August, 1973, Revised February, 1974. 24 fig, 2 tab, 13 ref

Descriptors: *Waste water treatment, *Denitrification, *Nitrification, Oxygen, Sludge treatment, Trickling filters, *Reviews, *Treatment facilities.
Identifiers: Settling tanks.

Nitrification and denitrification occur in waste water treatment. Nitrification has been considered beneficial because of the oxygen resource that the nitrates provide. The problems of rising sludge in conventional activated sludge and standard rate trickling filter plants are due to denitrification. The common way of controlling the problem was to limit nitrification. Information is needed on how waste water treatment plants can be designed to accomplish nitrification and denitrification. Factors affecting nitrification kinetics including denitrification and population dynamics, nitrification kinetics, and oxygen nitrification systems are discussed. Design criteria of nitrification systems in terms of the nitrification and settling tanks are described. Denitrification tanks, settling tanks, sludge, and effluent quality are discussed. Nitrification-denitrification facilities can achieve 90% removal of total nitrogen from the waste water treated. (Orr-FIRL)

**WASTEWATER FILTRATION, DESIGN CONSIDERATIONS.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Seminar Publication, July, 1974. 36 p, 12 fig, 2 tab, 23 ref.

Descriptors: *Waste water treatment, *Filtration, *Filters, *Design criteria, Efficiencies, Costs, Water treatment, Separation techniques, *Reviews.

The efficiency and cost of filtration are a function of the concentration and characteristics of the solids in suspension; the characteristics of the filter media and other filtering aids used, the characteristics of the solids in solution in the water filterd, the characterstics of the filter and its method of operation. Filter design involves finding the operational optimum characteristics and the economic optimum design. The factors necessary for the proper design of granular filters for the filtration of secondary effluents are discussed. Emphasis is placed on the differences between water treatment practices and waste water treatment practices which must be considered for the successful design of waste water filters. Recommendations are: the variable hydraulic and suspended solids load in secondary effluents must be considered; a filter that allows penetration of suspended solids is essential to obtain reasonable filter run lengths; the backwash water flow rate should be large enough to fluidize the coarser-sized grains of each component of the filter media; more uniform media sizes are desirable; auxiliary agitation of the media is essential to proper backwashing; the filtration rate and terminal headloss should be selected to achieve a minimum filter run length of 6-8 hrs. during peak load conditions; and, lower filtration rates or lower influent suspended solids may permit the economical use of gravity filters where multiple filters are needed. (Orr-FIRL)
W75-09383

**PHYSICAL-CHEMICAL NITROGEN REMOVAL, WASTEWATER TREATMENT.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Seminar Publication, July, 1974. 24 p, 10 fig, 24 ref.

Descriptors: *Nitrogen, *Waste water treatment, *Ion exchange, *Chlorination, Ammonia, Costs, Municipal water.
Identifiers: *Physical-chemical treatment, *Nitrogen removal, *Ammonia stripping, Selective ion exchange, Breakpoint chlorination, Technology transfer.

Three basic physical-chemical nitrogen removal techniques are available for the treatment of waste water. These are: ammonia stripping, selective ion exchange, and breakpoint chlorination. Each approach has the advantage of being based on the removal of nitrogen in ammonia form, eliminating the cost of converting the ammonia to nitrate in the biological treatment step. The techniques are also unaffected by toxic compounds that might disrupt the removal system. All three methods are predictable in performance, and space requirements for the treatment units are less than for biological treatment units. The ammonia stripping process has the advantages of low cost, ammonia removal with minimal dissolved solids addition, simplicity, and reliability. It performs poorly in cold weather and concern has been expressed over ammonia gas discharge. The selective ion exchange process has the advantages of high efficiency, insensitivity to temperature, ammonia removal with minimal dissolved solids addition, and elimination of nitrogen discharges to the atmosphere. Costs of this process are high, and process control and operation are complex. Breakpoint chlorination has low capital costs, high reliability, temperature insensitivity, and releases nitrogen as nitrogen gas. Its disadvantages are the addition of a substantial amount of dissolved solids to the effluent to remove ammonia, public concern over chlorine gas handling, and complex process controls. Costs and applications are discussed for nine United States cities. (Prague-FIRL)

**PHYSICAL-CHEMICAL WASTEWATER TREATMENT PLANT DESIGN.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Seminar Publication, August, 1973, Revised January, 1974. 41 p, 8 fig, 13 tab, 13 ref, 1 append.

Descriptors: *Waste water treatment, Facilities, *Design criteria, Coagulation, Filtration, Flocculation, Carbon filters, Adsorption, *Treatment facilities.
Identifiers: *Physical-chemical treatment.

Discussed are typical design parameters for the unit processes involved in the physical-chemical treatment of raw wastes, and how the design engineer may determine the design criteria best suited for a particular waste water. Chapter I deals with the selection of coagulant and discusses the classes of coagulants, lime coagulation, alum coagulation, iron coagulation, and a comparison of coagulant costs. Chapter II discusses carbon adsorption in terms of powdered carbon and column test results. Chapter III mix, flocculation, clarifier sizing, recarbonation, filtration, granular carbon adsorption, and carbon regeneration. The final chapter details the physical-chemical treatment of small waste flows and covers clarification-filtration-carbon treatment, sludge production, and sludge disposal. Design project descriptions are given of plants in Niagra Falls, N. Y. and Fitchburg, Mass. (Orr-FIRL)
W75-09385

**UPGRADING LAGOONS.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Seminar Publication, August, 1973. 43 p, 20 fig, 10 tab, 27 ref.

Descriptors: *Waste water treatment, *Lagoons, *Design criteria, Aerated lagoons, *Oxidation lagoons, Efficiencies, *Reviews.
Identifiers: High-rate aerobic ponds, Facultative ponds, Anaerobic ponds, Maturation ponds.

Lagoons are one of the most commonly used secondary waste treatment systems. Waste treatment lagoons can be divided into five general classes depending on the types of biological actions occurring in the lagoon: high-rate aerobic ponds; facultative ponds; anaerobic ponds; matu-

ration or tertiary ponds; and, aerated lagoons. A well-designed lagoon will incorporate physical features that minimize upsets, maintenance, and nuisances, and that maximize operational flexibility, stability, and BOD removal. Physical design features that should be considered include configuration, recirculation, feed and withdrawal variations, pond transfer inlets and outlets, dike construction, supplementation of oxidation capacity, and algae removal. These criteria are discussed in detail in reference to upgrading existing lagoons. Several examples of upgraded lagoons are presented. (Orr-FIRL)

**OXYGEN ACTIVATED SLUDGE WASTEWATER TREATMENT SYSTEMS, DESIGN CRITERIA AND OPERATING EXPERIENCE.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Seminar Publication, August, 1973, Revised January, 1974. 46 p, 14 fig, 13 tab, 3 ref, 2 append.

Descriptors: *Waste water treatment, *Domestic wastes, *Industrial wastes, *Oxygenation, *Activated sludge, Costs, Economics, Aeration, Water pollution control, *Design criteria, *Operation, *Reviews.
Identifiers: Unox.

The use of oxygen instead of air in the activated sludge process (as in the Unox system) is one example of improved technology to aid in pollution control. The primary distinguishing feature of the Unox system is that high purity oxygen is the source of oxygen for the microorganisms in the aeration basin. The Unox system uses a covered and staged oxygenation basin for contact of oxygen gas and mixed liquor. High purity oxygen enters the first stage of the system and flows cocurrently with waste water being treated through the oxygenation basin. Operating data and experience from specific programs are presented including results from treatment of domestic wastes, food processing wastes, pulp and paper mill wastes, textile wastes, metal processing wastes, and chemical and petrochemical wastes. The proper design and a Unox system requires the following basic information concerning the waste to be treated: waste water quantity; waste water quality; effluent quality required; and, definition of the other unit operations or existing facilities in the treatment plant and their relationship to the Unox system. In addition to process design, process safety, and Unox system scope of supply, economics of the system, specifications for final settling tanks, and specifications for oxygenation tanks are also discussed. **A GUIDE FOR STATE CERTIFICATION OF WASTEWATER FACILITIES PERSONNEL,**
Water Pollution Control Federation, Washington, D.C.
L. L. Guy, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-232 005, $3.75 in paper copy, $2.25 in microfiche. March, 1973. 29 p, 1 tab. EPA Award No 900181.

Descriptors: *State jurisdiction, *Personnel, Water pollution control, *Treatment facilities, Waste water treatment, Guidelines, Legislation, Surveys.
Identifiers: *Certification, Qualifications.

Certification of personnel in water pollution control facilities has become an accepted practice in the United States. Jurisdiction for making certification optional or mandatory is under the auspices of the states. Concern has been voiced that the diversity of programs weakens their effectiveness, and a national association of state programs may be formed. Efforts of the Environmental vocation skills in operating and managing waste water facilities, including planning, training, and certification programs. This guide details the requirements for an effective state program, and is a preliminary to nationally approved guidelines. Discussed are the results of six state surveys conducted since 1972. A model law which promotes the concept of certification but allows each state to determine its details, and types of operator classification from the entry level trainee up to the class IV plant superintendent, with qualifications for each is included. Difficulties with written examinations, renewal requirements, and enforcement problems are discussed. (Prague-FIRL)
W75-09389

**SYNTHETIC RESINS AND ACTIVATED CARBON FOR WASTEWATER TREATMENT,**
Illinois Univ., Urbana.
V. L. Snoeyink, B. R. Kim, R. L. Hinrichs, and P. Jennings.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-781 196, $4.75 in paper copy, $2.25 in microfiche. Air Force Weapons Laboratory, Kirtland AFB, New Mexico, Report AFWL-TR-74-112, June, 1974. 82 p, 18 fig, 4 tab, 44 ref.

Descriptors: *Waste water treatment, *Adsorption, *Activated carbon, *Resins, Organic wastes, Laboratory tests, Sewage treatment, Municipal wastes, Industrial wastes.
Identifiers: Regeneration.

This study examined the feasibility of using synthetic resins in place of or in combination with, activated carbon for adsorption processes of waste water treatment systems. An in-depth literature review of the use of resins as adsorbents was followed by bench-scale testing of potentially suitable resins using selected test compounds in single-solute systems as well as various types of activated sludge effluent. The choice of resin depends on the type of compounds to be adsorbed. Weak base resins appear to be most suitable for waters which contain a wide variety of organic compounds, such as secondary effluent, many industrial waste waters, and waters containing organic matter of natural origin. Weak base resins not only have the highest capacity and appear to be the most general type of adsorbent for heterogeneous solutions of organic compounds but also seem to have the most favorable properties for regeneration. The adsorption capacity of the resins and the number of species which could be adsorbed by the resins generally appeared to be less than those for activated carbon. Further research needs to be done with resins using the specific waste water to be treated because of the dependence of the performance of the resin on the types of species being adsorbed. (Orr-FIRL)

**IMPLEMENTATION OF WATER SUPPLY AND WASTEWATER PROGRAMS IN THE WASHINGTON, D.C. METROPOLITAN AREA.**
American Society of Civil Engineers, Washington, D.C. Water Pollution Task Force.
July, 1974. 39 p, 2 fig, 7 tab, 35 ref.

Descriptors: *Treatment facilities, Planning, *Water supply, Municipal water, Investigations, *District of Columbia, Water utilization, *Waste water treatment, *Water treatment.
Identifiers: *Washington(DC).

An evaluation of the existing waste water treatment facilities in the metropolitan Washington area was made and recommendations for improvement are given. The area is served by three water systems which are not connected; the combined available storage of treated water in the separate systems totals only about one day's supply. Based on the fact that peak demands have exceeded the low flow record, the situation is critical. On the basis of past problems, organizational changes, the funding situation, urban planning and growth, and general water use, several recommendations were made. These included: within existing management organizational structure, new means for reacting rapidly to problems should be found; design should be completed and construction begun immediately on interconnections between the three major water systems; a comparison of damages which would occur as a consequence of short-term water shortages versus the costs of a guaranteed fully adequate supply at all times should be made; investigations should begin of waste water treatment methods, to be planned for the entire region; disputes in the future should use as a model the new agreement on waste flows and sludge disposal, now implemented by the District of Columbia, Maryland, and Virginia, in order to facilitate admistrative cooperation; and, decisions regarding both money and space for treatment facilities, must involve the public. (Prague-FIRL)
W75-09392

**SEWAGE TREATMENT PLANT DEPENDABILITY WITH SPECIAL REFERENCE TO THE ACTIVATED SLUDGE PROCESS,**
National Field Investigations Center-Cincinnati, Ohio.
A. W. West.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-231 070, $3.25 in paper copy, $2.25 in microfiche. March, 1971. 12 p.

Descriptors: *Sewage treatment, *Design criteria, *Operation and maintenance, Facilities, *Activated sludge, Biological treatment, Water pollution control, Water quality control, *Treatment facilities, *Waste water treatment.

This work is a reference for sewage treatment plant dependability lectures presented at training sessions, symposia, and workshops. Design considerations necessary to achieve consistently satisfactory plant performance and final effluent quality include the proper treatment processes, a generous plant capacity, essential flexibility, and true controllability of the plant. The treatment process or modification most appropriate to the known waste characteristics and effluent quality requirements should be chosen. Examples include the classic activated sludge process, the complete mix modification and the step aeration modification. Pilot studies on a bench, pilot, or demonstration scale may be performed to resolve uncertainties about the correct process to choose. The suggestions contained in design criteria manuals such as the '10-States Standards' and should be considered as minimum requirements needed to provide adequate safety factors to assure plant dependability. Items discussed under flexibility of a plant include: process; aeration tanks; final clarifiers; return sludge pumping facilities; excess sludge wasting; emergency chemical treatment; sludge handling facilities; equalizing tanks; and holding ponds. The activated sludge system is a controllable process that should have the appropriate meters and accurately controllable gates, valves, pumps, and blowers for optimum performance. Qualified operators are needed to achieve the high quality effluent that can be produced by a properly designed waste treatment plant; dedicated, experienced operators are needed even more at plants which have design defects. **THE ROLE OF POLYELECTROLYTES IN FILTRATION PROCESSES,**
North Carolina Univ., Chapel Hil. Dept. of Environmental Sciences and Engineering.
C. R. O'Melia.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-233 271, $4.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-670/2-74-032, April, 1974. 81 p, 24 fig, 5 tab, 34 ref.

Descriptors: *Filtration, *Waste water treatment, *Polyelectrolytes, *Prettreatment, *Chemical reactions, Polymers, Chemicals, Coagulation, Trickling filters, Particle size, Filters.

Research was conducted to determine how destabilizing chemicals act in augmenting the effectiveness of filtration processes and to examine selected applications of destabilizing chemicals in filtration for the treatment of waste water. The chemical destabilization required for effective filtration was similar to that required for effective coagulation. Chemical pretreatment was necessary for effective filtration of all systems considered in this research. The optimum chemical dosage for a jar test or batch coagulation test is the chemical dosage that will provide the best effluent quality in a filtration process. If polymers are used as destabilizing chemicals, overdosing may occur due to restabilization of the suspended particles. For the cationic polymer series tested, the optimum polymer dosage was independent of the molecular weight of the polymer, but the removal efficiency of filters operated at this optimum dosage increased with increasing molecular weight. When proper chemical pretreatment occurs, conventional filter beds are capable of removing almost all particles applied to them, regardless of suspended particle size. If effective filtration is not achieved, it should be attributed to poor chemical pretreatment. Other conclusions made concern the mechanisms of polymer action in filtration, and the results that can be obtained using polymers as filter-aids. (Orr-FIRL)

**CONTROL SCHEMES FOR THE ACTIVATED-SLUDGE PROCESS,**
National Environmental Research Center, Cincinnati, Ohio.
R. Smith, and R. G. Eilers.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-236 086, $4.25 in paper copy, $2.25 in microfiche. Report EPA-670/2-74-069, August, 1974. 55 p, 19 fig, 34 ref.

Descriptors: *Computer model, *Activated sludge, Dissolved oxygen, Settling, Separation techniques, Municipal wastes, Control systems, Model studies, *Waste water treatment.
Identifiers: Sludge inventory control, Sludge wasting control.

A time-dependent computer model for the activated sludge process has been used to investigate potential advantages of a number of control schemes. The systems studied by this model include dissolved oxygen control, sludge wasting control, and sludge inventory control. The program input variables are given; quantitative benefits for control schemes are shown. The dissolved oxygen control installed in a typical 25-mgd (1.1 cu m/sec) municipal plant would reduce electrical power consumption for air supply by about 17 percent. If the blower is scheduled in a step pattern, about 11.5% of the electrical power might be conserved. However, the potential is minimal for reduction of dissolved BOD concentration in the effluent stream by means of food and microorganism control, using the final settler for sludge storage. The effectiveness of the final settler for separation of dissolved and suspended fractions of BOD is an important aspect of the simulation for which adequate relationships are lacking. (Prague-FIRL)
W75-09395

**AN EVALUATION OF THE HAGERSTOWN, MARYLAND WATER POLLUTION CONTROL PLANT,**
National Field Investigations Center-Cincinnati, Ohio.
A. W. West, and R. J. Loubey.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-231 072, $3.75 in paper copy, $2.25 in microfiche. November, 1973. 31 p, 1 fig, 8 tab, 1 append.

Descriptors: *Waste water treatment, *Water pollution control, *Sewage treatment, Control, Equipment, Sludge, Clarification, Sedimentation, Pumps, Aeration, *Treatment facilities, Water quality standards, *Maryland.
Identifiers: Clariers, Hagerstown(Md).

The City of Hagerstown, Maryland, Water Pollution Control Plant experienced difficulty in maintaining consistent effluent quality between January 1972 and April 1973. Reasons for the difficulties were severe overloading of the primary clarifiers, high organic loads imposed on the secondary system because of primary system deficiencies, hydraulic overloading of the aeration tanks and final clairifiers during periods of sustained high flow, hampering of the process control by an overall lack of flow meters and controls, inability to feed the flow to the various units to maximize the efficiency of the secondary system, and inability to accurately control the return and waste sludge flows. Recommendations included these immediate modifications: two rectangular primary clarifiers should be converted into sludge holding/thickening tanks; the circular primary clarifier should be converted into an additional final clarifier; variable speed drive pumps should be provided; meters and control valves should be installed; modification of the circular primary clarifier piping should include plans for its use as a final clarifier; and two blowers should be repaired to provide additional aeration capacity. Long range modification recommendations were for the installation of: separate pumps and meters for excess sludge wasting; meters and valves or gates to measure and control the various sludge, sewage, and liquor flows; a central meter and control panel to permit remote adjustment of valves and pumps; automatic density controllers to aid in sludge handling; and, new primary sedimentation units to replace the inadequate units. **WASTEWATER SURVEY, CHANUTE AFB, ILLINOIS.**
Environmental Health Lab., Kelly AFB, Tex.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-784 784, $3.75 in paper copy, $2.25 in microfiche. Report EHL (K) 74-13. July, 1974. 39 p, 3 append.

Descriptors: *Surveys, *Sewage treatment, Sampling, *Treatment facilities, *Water quality standards, Waste discharge, *Illinois, *Waste water treatment, Water pollution sources, Water pollution control, Tertiary treatment.
Identifiers: Storm drainage system, Chanute AFB(Ill).

Data and a discussion of the results of a field waste water survey conducted at Chanute AFB, Illinois, in May 1973 are presented. Physical, chemical, and biological sampling and analyses of the sewage treatment facilities and the receiving stream of the base were accomplished. Existing waste water treatment facilities do not provide an effluent that meets current or projected requirements. Extensive addition and modification or a complete new facility is required to comply with local discharge standards which require as little as four mg/liter BOD5 and five mg/liter of suspended solids in the effluent. This can be achieved with advanced waste treatment methods. In addition, action is required to insure that industrial waste waters are not discharged to the storm drainage system and that the sanitary sewer lift pumps do not overflow to the storm drainage system. **EVALUATION AND DEMONSTRATION O THE CAPILLARY SUCTION SLUDGE DE WATERING DEVICE.**
Westinghouse Research Labs., Pittsburgh, Pa.
T. E. Lippert, and M. C. Skriba.
Available from the National Technical Informa tion Service, Springfield, Va. 22161, as PB-23 358, $3.75 in paper copy, $2.25 in microfiche. En vironmental Protection Agency, Report EPA 670/2-74-017, March, 1974. 47 p, 30 fig, 5 tab, 3 ap pend.

Descriptors: *Dewatering, *Sludge treatment *Waste water treatment, *Capillary action Anaerobic digestion, Pilot tests, Costs.
Identifiers: Sludge drying.

A device for dewatering waste activated sludge used capillary suction in a porous belt. The system has been demonstrated on a pilot scale test unit. The device uses capillary action to initially de water the sludge, which forms a thin sludge cake. This cake is then mechanically compressed in a final step to obtain a still dryer cake. Both de watering steps are incorporated into a single system endless belt design. Sludge feed capacities from 2.0 to 4.5 lbs/hr ft have been demonstrated using the cake solids at discharges ranging from 1 to 18 percent. Results were obtained with a condi tioned waste activated sludge at a coagulant cost of approximately $4.00/ton. The device also has been tested on an anerobically digested and a mixed primary-activated sludge. (Prague-FIRL)

**DOMESTIC WASH WATER RECLAMATION FOR REFUSE AS COMMODE WATER SUPPLY USING A FILTRATION-REVERSE OSMOSIS SEPARATION TECHNIQUE,**
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
J. B. Hall, Jr., C. E. Batten, and J. R. Wilkins.
Available from the National Technical Information Service, Springfield, Va. 22161, as N-74-19607, $3.75 in paper copy, $2.25 in microfiche. NASA TN D-7600, April, 1974. 34 p, 3 fig, 9 tab, 17 ref, 2 append.

Descriptors: *Waste water treatment, *Reverse osmosis, *Filtration, *Water reuse, Water purification, Chlorination, Water conservation, *Water supply, Domestic water, Domestic wastes, *Separation techniques.

An evaluation of a combined filtration-reverse osmosis water recovery system was conducted to determine its capability to reclaim domestic wash water for reuse as a commode water supply. The water produced by this system met all chemical and physical requirements established by the U.S. Public Health Service for drinking water with the

exception of carbon chloroform extractables methylene blue active substances, and phenols. This water is considered to be of a quality able to be reused as commode supply water. The filters used to protect the reverse-osmosis unit from plugging were not capable of removing particles less than one micrometer in size from the waste water. The process rate of the reverse osmosis unit was degraded approximately 46.9% for 713 gallons of filtered wash water processed. Averages of 0.00897 killowatt-hour per gallon and 0.0639 kilowatt-hour per gallon were needed to process the wash water through the filtration unit and reverse osmosis unit, respectively. Treatment of the processed water with 5 ppm chlorine was sufficient to reduce the microorganisms in the commode tank to zero. However, efficient mixing of chlorine was necessary in order to rapidly inhibit microorganisms in the processed water tank. The viability of a combined filtration and reverse osmosis technique for the reclamation of domestic wash water is established by this evaluation. The reverse osmosis module, if sufficiently protected from plugging by a filter capable of removing solid materials less than one micrometer in size, is a good low energy method for removing contaminants form domestic wash water. **EVALUATION OF MUNICIPAL SEWAGE TREATMENT ALTERNATIVES.**
Battelle-Pacific Northwest Labs., Richland, Wash.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-233 489, $10.50 in paper copy, $2.25 in microfiche. February, 1974. 411 p, 35 fig, 6 tab, 219 ref, 3 append. EQC 316.

Descriptors: *Waste water treatment, *Reviews, Costs, *Environmental effects, Municipal wastes, Waste disposal, Ocean disposal, Aeration, Sewage treatment, Evaluation, Landfills, *Cost comparisons, *Cost analysis.
Identifiers: Sanitary landfills.

A comparison was made of alternative waste water treatment strategies. Both their costs and environmental effects were considered. Available municipal waste water and sludge treatment processes were selected on the basis of current or projected use in various sized flow regimes. Included were: primary treatment with land disposal of liquid effluents; waste stabilization lagoons; trickling filters with surface water discharge; trickling filters with land disposal; activated sludge with surface water discharge; activated sludge with land disposal; biological-chemical treatment; activated sludge-coagulation-filtration; tertiary treatment; physical-chemical treatment; extended aeration; sludge thickening, chemical conditioning, vacuum filtration, incineration, and landfill; chemical digestion, and ocean dumping by pipeline; and several other options. Each set of liquid treatment strategies and sludge options was characterized as to resource input requirements and subsequent outputs. (Prague-FIRL)

**A PRELIMINARY ASSESSMENT OF WET SYSTEMS FOR RESIDENTIAL REFUSE COLLECTION,**
Curran Associates, Inc., Northhampton, Mass.
P. M. Meier, J. Kuhner, and C. J. Martel.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-234 496, $6.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-670/2-74-065, July, 1974. 166 p, 36 fig, 25 tab, 2 append.

Descriptors: *Treatment facilities, *Domestic wastes, Waste disposal, Hydraulic conductivity, Planning, Costs, Sewers, Sewage treatment, *Waste water treatment.
Identifiers: *Grinders, Refuse collection, Household grinders.

The most promising wet system alternative for residential refuse collection is described. It involves a system using individual household grinders in low density areas, vacuum collection and neighborhood grinders in high density areas, dilute slurry transport of ground refuse in the existing sanitary sewer systems, and joint treatment of refuse and sewage at an expanded treatment facility, including anaerobic digestion for methane generation. However, the economic feasibility of even the most promising alternative is doubtful because of the high cost of grinding. Hydraulic transport of ground refuse in existing sewer systems may be feasible only if both metals and glass are excluded. A conventional collection of the nongrindable and bulky constituents of residential refuse will still be needed, even if on a diminished frequency. Projected costs are also discussed. (See W75-04577, W75-09406 and W75-09407) (Prague-FIRL)

**ECONOMIC ANALYSIS OF THE PROCESSING AND DISPOSAL OF REFUSE SLUDGES,**
Curran Associates, Inc., Northampton, Mass.
P. Kos, P. M. Meier, and J. M. Joyce.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-234 498, $4.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency Report EPA-670/2-74-037, July, 1974. 69 p, 29 fig, 5 tab, 48 ref.

Descriptors: *Domestic wastes, *Incineration, *Sludge treatment, *Waste disposal, Treatment facilities, *Waste water treatment, Costs, *Cost analysis.
Identifiers: *Wet systems.

The feasibility of sludge handling and disposal at waste water treatment facilities is discussed. These are modified to accept up to 0.5 percent by weight of ground residential refuse in their sewage influents. Using computer simulation techniques, the sensitivity of sluge handling and disposal operations to operating parameters and input conditions is examined. A substantial decrease in the unit cost of sludge handling, on a per ton of dry solids basis, over plants treating sewage alone can be expected. Suitable process chains include gravity thickening, vacuum filtration, and either landfill or incineration. (See also W75-09405) (Prague-FIRL)

**WET SYSTEMS FOR RESIDENTIAL REFUSE COLLECTION: A CASE STUDY FOR SPRINGFIELD, MASSACHUSETTS,**
Curran Associates, Inc., Northampton, Mass.
P. M. Meier, J. Kuhner, and R. E. Bolton.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-234 499, $7.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency Report EPA-670/2-74-038, July, 1974. 207 p, 37 fig, 34 tab, 26 ref.

Descriptors: *Sewerage, *Domestic wastes, Hydraulic conductivity, Costs, Treatment facilities, Planning, *Massachusetts, *Waste water treatment.
Identifiers: *Springfield(Mass), *Wet systems, *Refuse collection.

A case study implementation of the wet systems concept for residential refuse collection in the Springfield, Massachusetts, urbanized area is detailed. Analyses of the problems of hydraulic transport of ground refuse in the Springfield sewer system; treatment of a modified waste water treatment plant; the impact on resource recovery and conventional solid waste management; socioeconomic, institutional and fiscal ramifications; and a total systems cost analysis showing annual per household costs for refuse and sewage management are given. Implementation of the system on a domestic level, however, is thought to be at least ten years distant, due to unresolved technical uncertainties. A program of further laboratory investigations is recommended. (See also W75-09405) (Prague-FIRL)
W75-09407

**AN EVALUATION OF WATER REUSE FOR MUNICIPAL SUPPLY,**
Butler Univ., Indianapolis, Ind. Holcomb Research Inst.
D. Dworkin, and D. D. Baumann.
Available from the National Technical Information Service, Springfield, Va. 22161. Army Engineer Institute for Water Resources, Contract Report 74-11; December, 1974. 265 p, 31 fig, 33 tab, 6 append.

Descriptors: *Simulation analysis, *Municipal water, *Water supply, *Water reuse, Evaluation, Recycling, Systems analysis, Costs, Public health, Engineering, Water demand, Colorado, *Computer models, Model studies.
Identifiers: Colorado Springs(Colo), Economic efficiency.

A simulation model for evaluating the economic efficiency of water reuse is given. This is applicable to a single community for planning its possible recycling system. Two problems related to low community adoption of water reuse are the unavailability of such a method to assess the relative value of reuse and the professional biases of consulting engineers and public health officials. The use of renovated waste water in water supply planning is illustrated by the example of Colorado Springs, Colorado. A simulation model gives a plan as well as an alternative plan for the next fifty years, beginning in 1974. Expected water demand is based on demographic patterns and considers residential, industrial, commerical, municipal, military, and nonpotable use. Costs and benefits are included in the computer models. (Prague-FIRL)

**AGRICULTURAL BENEFITS AND ENVIRONMENTAL CHANGES RESULTING FROM THE USE OF DIGESTED SLUDGE ON FIELD CROPS,**
Metropolitan Sanitary District of Greater Chicago, Ill.
T. D. Hinesly.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-236 402, $10.00 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA/530/SW-30d.1, 1974. 375 p, 83 fig, 164 tab, 173 ref.

Descriptors: *Viruses, *Sludge, Land use, Soil, Water samples, Public health, Groundwater, Agriculture, Fertilizers, Drainage, Water quality control, Benefits, *Beneficial use, Water reuse.
Identifiers: Digested sludge, Sludge application.

The effects of digested sludge application on the chemical composition of soil, plant, and water samples from a large field lysimeter facility are discussed. Specific hygienic aspects of digested sludge were also investigated. It was found that viruses are not likely to survive the heated anaerobic digester environment. Although digested sludge contains large populations of fecal coliform bacteria, these organisms die rapidly during storage and after spreading on the soil. Results from green house and field studies indicate that several crop plants show favorable growth responses when fertilized with digested sludge. As long as digested sludge application rates do not exceed those which will result in unacceptable concentration levels of NO3-N in drainage or groundwaters, sludge of the quality employed in this study can be safely used to increase the production of quality crops. (Prague-FIRL)

**COMPREHENSIVE SURVEY OF MAGPIE CREEK, MCCLELLAN AIR FORCE BASE, CALIFORNIA,**
Environmental Health Lab., McClellan AFB, Calif.
C. F. Pauls, and T. R. Doane.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-784 819, $4.25 in paper copy, $2.25 in microfiche. Professional Report No 73M-2, April, 1973. 53 p, 12 fig, 12 tab, 5 ref, 3 append.

Descriptors: *Surveys, *Domestic water, *Sewage treatment, *Treatment facilities, Streams, Effluents, Waste disposal, Sampling, Water quality standards, California, *Waste water treatment.
Identifiers: Magpie Creek(Calif), McClellan AFB(Calif).

A survey of the McClellan AFB domestic sewage treatment plant was conducted. A study was made of the stream water quality of Magpie Creek, which flows through the base and carries the effluents of McClellan Base's domestic and industrial waste treatment plants. The stream was sampled both biologically (Qualitatively) and chemically (quantitatively). Based on studies on the benthic macroinvertebrates found, the stream shows improved quality upon leaving the base as compared to where it enters the base. The McClellan AFB domestic treatment plant effluents are regulated by the State of California as to BOD concentration, settleable solids, oils, and grease; the survey showed that the Base was within specified limits for all these constituents. Industrial discharges into Magpie Creek, from all industries, were also within water quality standard requirement limits. However, an Industrial Waste Treatment Facility, not yet completely installed, does not have sufficient operational control. In addition, several pipes, sink drains, floor drains and pipe drains have outlets discharging directly into Magpie Creek, from unknown origin. It was strongly recommended that these lines be rerouted to the sanitary or industrial waste sewerage system. This will prevent any spill of toxic materials to the now acceptable waters. **PHOSPHATE REMOVAL IN AN ACTIVATED SLUDGE FACILITY,**
Municipality of Metropolitan Seattle, Wash.
R. E. Finger, G. J. Mason, D. A. Carlson, and G. L. Minton.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-235 749, $4.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA 670/2-74-061, August 1974. 92 p, 23 fig, 17 tab, 132 ref.

Descriptors: *Activated sludge, *Alum, *Ferric chloride, Phosphorus, Biological treatment, Chemical treatment, Sludge, Phosphates, *Waste water treatment.
Identifiers: *Phosphorus removal.

Both the biological and the chemical means of phosphorus removal were studied for the activated sludge facility at Seattle's Renton, Washington plant. Tests conducted on secondary activated sludge ranged, from jar tests to full scale plant investigation. Results indicate that the observed removal of phosphorus in this soft water area activated sludge facility is mainly biological. Careful control of organic loading rates, air application rates and excess sludge wasting rates can increase removal somewhat. However, even under optimal conditions, the biological mechanism does not consistently reduce the phosphorus concentration to a desired 1.0 mg/liter. Both ferric chloride and alum can effectively remove the phosphorus, and are controlled by automation. Sludge is produced with the addition of either alum or ferric chloride, with the former causing a denser final sludge. Capital costs for either chemical are the same, but alum requires a larger storage tank area. It was also recommended that the use of polyelectrolytes in conjunction with alum or ferric chloride be investigated. (Prague-FIRL)
W75-09412

**SURVEY OF WASTEWATER DISCHARGE, CAMPION AFS, ALASKA,**
Environmental Health Lab., Kelly AFB, Tex.
C. F. Pauls, and J. F. Thomas.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-784 785, $3.25 in paper copy, $2.25 in microfiche. Technical Report EHL(K) 74-14, July 1974. 8 p, 2 ref, 4 append.

Descriptors: *Waste discharge, Water quality control, Surveys, Waste disposal, Domestic wastes, *Waste water treatment, *Sewage treatment, Water quality standards, Monitoring, Sampling, *Alaska, Tertiary treatment.
Identifiers: Campion AFS(Alas), Model B-Oxigest Treatment.

A survey of waste water discharge at Campion AFS, Alaska, was conducted between June 27 and June 29, 1973. Most of the waste waters from Campion are discharged to a sanitary sewage treatment system. Secondary treatment of domestic waste water generated by 130 persons is provided by a Model B-Oxigest package treatment system. Water pollution monitoring was evaluated in order to comply with water quality criteria of Alaska. In addition, industrial operations which generated waste water were investigated. With the exception of waste brines generated by a water softening plant, non-domestic or industrial sources of pollutants were insignificant. Although Campion AFS had no records of former sewage treatment plant performance and had conducted no previous laboratory testing of effluent water quality, the sewage treatment outfall proved to be clear and showed no evidence of undesirable conditions. It was recommended that water quality be monitored, and that sampling be conducted of the sewage treatment system to assure future water quality control. (Prague-FIRL)

**RECENT DEVELOPMENTS IN SEWAGE TREATMENT BASED ON PHYSICO-CHEMICAL METHODS,**
Water Pollution Research Lab., Stevenage (England).
P. F. Cooper, and E. V. Thomas.
Water Pollution Control, Vol 73, No 5, p 505-520, 1974. 7 fig, 11 tab, 17 ref.

Descriptors: *Sewage treatment, Activated carbon, Pilot plants, *Waste water treatment, Clarification, Treatment facilities, Biological treatment, Costs.
Identifiers: Great Britain, *Physico-chemical treatment.

Physico-chemical treatment for sewage is defined as chemically aided clarification followed by the removal of dissolved organic material usually by adsorption on activated carbon. Physico-chemical treatment (PCT) is more common in the United States than in Great Britain, but is still at the pilot plant stage. Advantages claimed for PCT over biological treatment include reductions in capital costs and land requirements; easier control of the plant in terms of adapting to fluctuations in sewage quantity and quality; reduced susceptibility of the chemical stage to toxic materials; and, almost complete removal of phosphorus and some removal of nitrogen where eutrophication is a problem. Recent developments in the United States and tests in Great Britain are descri

**PHOSPHORUS REMOVAL DEMONSTRATI
STUDIES AT C.F.B. TRENTON,**
Environmental Protection Service, Otta
(Ontario).
W. E. Stepko, and E. E. Shannon.
Technology Development Report EPS 4-WP-74
September 1974. 35 p, 14 fig, 12 tab, 7 ref.

Descriptors: *Alum, *Activated sludge, Treatm
facilities, *Canada, Monitoring, Biochemical
ygen demand, Suspended solids, Digestion, Wa
water treatment, Phosphorus.
Identifiers: *Phosphorus removal.

Full scale phosphorus removal studies, employi
alum addition to an activated sludge treatm
plant, were conducted at Canadian Forces Ba
(C.F.B.) Trenton. Treatment plant performan
was closely monitored with respect to BOD5, to
phosphorus, and suspended solids remova
under baseline conditions, and at various alum a
dition levels. The required alum dosage f
phosphorus removal was 3.0 to 3.5 mg/liter as
and the most effective addition point was at t
exit end of the aeration basins. Alum additions i
proved suspended solids removal efficiencies a
maintained BOD5 and turbidity removal efficie
cies at baseline levels. During periods of zero alu
addition, a residual phosphorus removal effe
was observed. An in-depth investigation of this e
fect was recommended to determine if phosphor
removal requirements can be met at reduced alu
dosages. Digester capacity was inadequate a
digester supernatant quality was poor, so that 70
of the phosphorus removed from the plant in th
raw sludge eventually recycled back to the prim
ry clarifier. A proposed solution to this proble
was the addition of a second digestion stage to th
plant. (Prague-FIRL)

**REMOVAL OF WASTEWATER ORGANICS B
REVERSE OSMOSIS,**
Baker (Michael), Jr., Inc., Beaver, Pa.
W. A. Duvel, Jr., and T. Helfgott.
Journal Water Pollution Control Federation, Vo
47, No 1, p 57-65, January, 1975. 5 fig, 1 tab, 1
ref.

Descriptors: *Waste water treatment, *Revers
osmosis, Organic wastes, Phenols, Municipa
wastes, Industrial wastes, Permeability, Solutes.

Although the advantages and limitations of revers
osmosis as both a separation and a concentratio
technique have been established, the efficiency o
removal of specific organics such as those tha
might be found in municipal and industrial waste
waters is not well known. This investigation wa
undertaken to answer the following questions:
What characteristics of a solute molecule cause to
be rejected or allow it to pass through membranes
in the reverse osmosis process; Why are some
solutes rejected and others not; and, By what
mechanisms do molecules actually pass through
the membrane. Solute rejection was found to be
semiquantitatively related to both molecular
weight and molecular size; molecular size, as
determined by steric geometry, was the more im-
portant factor. The chemical characteristics of a

olecule , particularly its ability to form hydrogen onds, are qualitatively important in determining ermeability. A descriptive mechanism of mem- rane permeation explins the transport of organic aterials through reverse osmosis membranes. his theory makes it possible to predict the suc- ss of reverse osmosis in treating waters con- iminated by soluble and colloidal organic matter, long as the chemical nature of the individual ntaminants is known. In addition, a constituent hich is permeable might be chemically modified a nonpermeable form. For example, phenol hich is a highly permeable solute could be ox- ized with ozone or chlorine dioxide to alter it emically to a less permeable solute. (Orr-FIRL)

EDUCTION IN SURFACTANTS BY IRRADIA- ION,
orida Inst. of Tech., Melbourne. Univ. Center r Pollution Research.
. M. Rohrer, and D. D. Woodbridge.
ulletin of Environmental Contamination and oxicology, Vol 13, No 1, p 31-36, January, 1975. fig, 14 ref.

escriptors: *Waste water treatment, Detergents, *Surfactants, *Irradiation, Domestic astes, Municipal wastes, Surface tension, Linear alkylate sulfonates.

lthough detergents have been determined to be me of the largest contributors to water pollution, e pollution is not produced by the total chemical nstituents of the detergents but rather by certain ecific chemical structures. Linear Alkylate Sul- nate (LAS) is used as a wetting agent in certain etergents because it creates an effective surface rrier at the water/air interface. This study was signed to investigate the effect of ionizing radia- on on Linear Alkylate Sulfonate to overcome the rface tension effect of detergents. More than 0 aqueous samples containing LAS at concen- ations of 2.5, 5.0, 7.5, and 10.0 mg/liter were ir- diated such that they absorbed 10, 20, 40, 60, 80, d 100 K rads of energy. The results showed that diation can effectively reduce the concentration LAS in aqueous solutions. It was also demon- rated that the rate of irradiation is not nearly as portant in the reduction of LAS as is the total sorbed energy. (Orr-FIRL)

OLUME EXTRACTION OF CHEMICALLY ONTAMINATED WATER,
estinghouse Electric Corp., Abingdon, Va. Wire iv.
. W. Shelley, Jr.
ire Journal, Vol 8, No 3, p 67-75, March, 1975. 8 g, 1 tab.

escriptors: *Waste water treatment, *Separation chniques, *Chemical wastes, Industrial wastes, Waste disposal.

n industrial accident, in which a valve was pened allowing 500 gal of an emulsified cresylic id and ortho-dichlorobenzene solution to enter a ant's sewage system and contaminate a 300,000 l holding tank, created a massive treat- ent/disposal problem for Westinghouse Electric orporation. The original plans called for storage nd subsequent decontamination of this water by ansporting it to a 500,000 gal plastic-lined dry nd, approximately 480 ft above the water table. owever, this plan was not acceptable to the ublic Health Department. Laboratory tests owed that decontamination could be accom- ished by extraction with methylene chloride. ,000 gal of methylene chloride were pumped into e contaminated tank. The water was agitated by vo large compressors pumping air into the 0,000 gal of water. Mixing continued for a period about six hours. The air compressors were rned off and the water layer and methylene hloride layer were allowed to separate for two hours. The methylene chloride was siphoned from the bottom of the holding tank by running a rubber hose to the bottom and pumping it into tank trucks which then carried the contaminated methylene chloride away to be reclaimed. After the removal of all possible methylene chloride, the air compressors were turned on again to agitate the extract and aerate the solution to remove by evaporation trace amounts of methylene chloride still in solution. FILTER-PRESSING WASTEWATER SLUDGE.
Water and Sewage Works, Vol 121, No 9, p 108-111, September, 1974. 1 fig, 1 tab.

Descriptors: *Waste water treatment, *Sludge disposal, *Sludge treatment, *Dewatering, *Filtration, Chemicals, Sewage treatment, Suspended solids, Biochemical oxygen demand, *Wisconsin, Landfill.
Identifiers: *Filter pressing, Edwards and Jones filter press, Kenosha(Wisc).

The Kenosha, Wisconsin, waste water treatment plant is the first one in the United States to dewater sewage sludge by filter pressing with the Edwards and Jones filter press. The Edwards and Jones filter press process was chosen because of the limited number of personnel required and the use of ferric chloride and lime instead of fly ash as conditioning chemicals. The sludge is continuously fed into the press at a maximum of 100 psi; as the sludge goes into the press, the solids are retained on the cloths and the filtrate comes out and goes into the head end of the plant to be recycled with the raw sewage. The complete cycle takes 3-4 hours. The moisture content of the sludge cakes is about 60%; the dry cake is disposed of as landfill. Used in the chemical conditioning are 50,000 ppm of ferric chloride on a dry weight basis and 120,000-150,000 ppm lime. The press has a capture rate of at least 99% of the incoming solids. Suspended solids for the filtrate are around 130 mg/liter and BOD is around 58-79. The cloth used to filter the waste water is a polypropylene monofilament of a low to medium porosity and will last a year and a half or two years. (Orr-FIRL)
W75-09420

TECHNOLOGICAL AND ECONOMIC EFFECTS OF THE CHANGE OF THE PRELIMINARY PURIFICATION TIME ON SLUDGE TREATMENT (TECHNOLOGISCHE UND OEKONOMISCHE AUSWIRKUNGEN DER VERAENDERING DER VORKLAERZEIT AUF DIE SCHLAMMBEHANDLUNG),
H. Hagen.
Wasserwirtschaft-Wassertechnik, Vol 24, No 8, p 277-279, 1974. 4 fig, 1 tab, 10 ref.

Descriptors: *Sludge treatment, *Costs, Waste treatment, Organic matter, Aerobic treatment, *Waste water treatment.
Identifiers: Activation basins, Sludge quantity, Residence time.

Sludge quantity within a waste water treatment plant depends upon the origin, the quantity of dry substance, and the water treatment plant depends upon the origin, the quantity of dry substances, and the water content of the sludge. Sludge originating from mechanical purification is different from excess sludge after purification. The quantity of sludge from preliminary purification decreases with decreasing residence time in the preliminary purification basin. An optimization calculation was carried out to determine the residence time in the preliminary purification basin at which the sum of the costs for preliminary purification and for sludge treatment approach a minimum. An optimum preliminary purification time of one to two hours was obtained, assuming a dry substance content of 5.7% in mixed sludge and 2.5% in excess sludge. Thus, the volume of the preliminary purification basin influences the composition of the sludge to be digested. If the residence time in the preliminary purification basin drops, the quantity of organic matter going to the aerobic stage rises, and with it the quantity of excess sludge to be removed from the activation basin. DISPOSAL OF CATTLE FEEDLOT RUNOFF ON AGRICULTURAL LAND,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
H. D. Wittmuss.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 501, $4.25 in paper copy, $2.25 in microfiche. Completion Report, June 1975. 50 p, 11 fig, 26 tab. OWRT A-029-NEB(2). 14-31-0001-5027.

Descriptors: *Farm wastes, *Feed lots, Waste disposal, Crop production, Pollution effluents, Sprinkler irrigation, Nutrients, Deep percolation, Absorption, *Agricultural runoff, Corn(Field), Chemical analysis, Waste treatment.
Identifiers: Feed lot runoff, *Effluent irrigation.

Cattle feedlot runoff was applied to sod planted corn for three years at rates up to 30 inches per year without pollution of soil, crop, surface water or groundwater. Data were collected on many areas of crop production to check the effect of effluent irrigation compared to water irrigation on sod planted corn. All tests to date show no discernible difference in forage or grain nutrient content. The grain yield was suppressed 20% or more by the sprinkler application of effluent every two weeks, compared to water irrigated plots, during the growing season. Water and effluent were applied to sod planted corn in ten applications with maximum applications of 30 inches a year for three years. The application was measured and analyzed chemically for nutrients. Forage and grain yields were determined and each was analyzed for nutrient composition. The percentage of crop uptake of applied nutrients was determined and ranged from 1 to over 100 percent and could be related to crop response in many cases. Percolate samples were collected from the 7-foot depth and analyzed chemically showing a slight increase in the nitrogen content below the effluent plots. The chemical composition of the soil was determined before, during and after the study.

Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 503, $3.25 in paper copy, $2.25 in microfiche. Completion Report, June 30, 1975. 13 p, 2 fig. OWRT A-030-NEB(1). 14-31-0001-5027.

Descriptors: *Biocontrol, *Bacteriophage, Sphaerotilus, *Waste water treatment, Isolation, Pollutant identification, *Aeration.
Identifiers: *Sphaerotilus natans, Extended aeration.

Six bacteriophage specific for Sphaerotilus natans were isolated. One bacteriophage, SN-1, was characterized in detail. Experiments employing an extended aeration unit were conducted to determine the practicality of biological control of Sphaerotilus under simulated field conditions. Streptomycin resistant Sphaerotilus was employed as seed in the system. Numbers of surviving Sphaerotilus, numbers of bacteriophage, sludge volume index and suspended solids were measured over several weeks. Results indicate that bacteriophage control of Sphaerotilus in systems which have a high flow-through rate is impractical because of the high wash-out rate of the bacteriophage.

**UPFLOW FILTRATION OF OXIDATION POND EFFLUENT,**
Nebraska Univ., Lincoln. Dept. of Civil Engineering.
T. J. McGhee.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 529, $3.25 in paper copy, $2.25 in microfiche. Completion Report, June 1975. 12 p, 6 tab, 3 ref. OWRT A-034-NEB(1). 14-31-0001-5027.

Descriptors: *Waste water treatment, Oxidation, Solid wastes, *Filtration, *Oxidation lagoons, Treatment facilities, Chemical oxygen demand, Biochemical oxygen demand, Suspended solids, *Nebraska, Municipal wastes.
Identifiers: *Upflow filtration systems.

An upflow filtration system employing a sand medium was constructed and operated at the Municipal Oxidation Ponds in Lincoln, Nebraska. The system was operated at loading rates of 0.5 to 3.0 gal/ft sq/min (6.25 to 37.5 gal/min) and backwashed at a rate of approximately 15 gal/ft sq/min (190 gal/min). Flow was provided by electrically driven centrifugal pumps. Routine data measures included COD and suspended solids of influent and effluent and BOD of influent and effluent when the solids concentration in the effluent met current discharge standards (30 mg/l). Modifications to the system made during the study included the addition of a steel grid to restrain the filter medium against premature expansion and substitution of a coarser sand (.5mm) for that originally used (.22mm). Conclusions were: (1) the suspended solids and BOD of oxidation pond effluent may be reduced by filtration through a sand medium; and (2) efficiency of removal decreases sharply with increased filtration rate.
W75-09522

**A COVERED DOMESTIC LAGOON SYSTEM FOR NATURAL GROUND WATER RECHARGE NEAR METROPOLITAN AREAS,**
Connecticut Univ., Storrs. Dept. of Civil Engineering
R. Laak.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 506, $3.75 in paper copy, $2.25 in microfiche. Completion Report, June 1975. 45 p, 7 tab, 1 fig, 3 ref, append. OWRT A-039-CONN(1). 14-31-0001-3807.

Descriptors: *Sewage lagoons, *Domestic wastes, *Soil treatment, Waste disposal, Groundwater recharge, Temperature, *Waste water treatment, Cities, Urbanization, Biochemical oxygen demand, Sludge, Septic tanks, Water reuse.
Identifiers: *Lagoon-soil system, *Lagoon treatment, Small community system, Soil clogging, Sub-surface disposal, Decreased biological oxygen demand, BOD5.

A transparent-covered 4,600 gallon facultative lagoon was tested over two years using raw domestic sewage. The effluent was disposed of by use of subsurface seepage beds. The covered lagoon caused no nuisance or odors and was located 125 feet from the nearest residence. The lagoon pretreatment caused less soil clogging than septic tank effluent due to greater BOD5 removal. The lagoon-soil system, however, did not remove more nitrogen or phosphate than the septic tank-soil system. The removal of BOD5 was measured to be temperature dependent in the lagoon. The experiment will be continued to measure the long term effects of sludge accumulation. (See also W73-06742) (deLara-Connecticut)

**MUNICIPAL SLUDGE MANAGEMENT, PROCEEDINGS OF THE NATIONAL CONFERENCE ON MUNICIPAL SLUDGE MANAGEMENT.**
Held June 11-13, 1974 at Pittsburgh, Pennsylvania, The Pittsburgh Section of the American Society of Civil Engineers and the U.S. Environmental Protection Agency. Published 1974, Information Transfer, Inc., Washington, D.C., 218 p.

Descriptors: *Waste water treatment, Conferences, *Reviews, *Sludge disposal, *Sludge treatment, *Treatment facilities, Incineration, Filtration, Dewatering, Thickening, Digestion, Legislation, Regulations, Water quality control, Tertiary treatment.
Identifiers: *Composting, Sludge management, Conferences, State-of-the-art reviews.

Twenty-seven papers as well as the keynote and closing addresses are presented. Engineers, environmentalists, consultants, and municipal and federal administrators were participants. Several papers dealt with specific unit analyses of the methods of sludge handling and disposal. These included: sludge thickening, sludge dewatering, incineration, heat treatment, pressure filtration, composting, ocean disposal, trench incorporation, and pasteurization of liquid digested sludge. Treatment facilities at individual cities were described, detailing those at Chicago (Ill.), Denver (Colo.), Speedway (Ind.), Blue Plains (Washington, D.C.), Cedar Rapids (Iowa), Ontario (Canada), Philadelphia (Pa.), Pensacola (Fla.), St. Louis (Mo.), and Twin Cities (Minn.). The economics of sludge, as a profitable by-product of waste water treatment, are illustrated by its market value as a fertilizer, by experiments with sludge irrigation of agricultural crops, and by its value in the reclamation of soils lacking organic nutrients. The effects of public relations, federal legislation, and water quality standards on sludge management are also examined. (See W75-09533 thru W75-09558) (Prague-FIRL)
W75-09532

**OVERVIEW OF SLUDGE HANDLING AND DISPOSAL,**
National Environmental Research Center, Cincinnati, Ohio.
J. B. Farrell.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 5-10, 1974. 3 fig, 3 tab, 10 ref.

Descriptors: *Sludge treatment, *Sludge disposal, Reviews, Municipal wastes, Dewatering, Filtration, Sewage sludge, Toxicity, Landfill, Tertiary treatment, *Waste water treatment.
Identifiers: Land application, Co-pyrolysis, Co-incineration.

A review is given of both the treatment and u disposal operations now used for municipal was water treatment of sludge. Trends from 1972 1985 are outlined; it is predicted that the amount secondary treatment sludge will be almost do bled, and chemical sludges will be produced quantity. It is also predicted that dewatering cos will increase as more municipalities upgrade facil ties to improve effluent quality because biologic secondary sludges and some types of chemic sludges are difficult to dewater. Treatment oper tions have been classified as thickening, stabiliz tion, dewatering, and conditioning. Dispos operations include knowledge of hazards or toxic ty, and use of land application, landfill, or ir cineration. Trends in disposal are difficult t forecast. Ocean disposal appears negative. Lan application must be subject to many guidelines landfill sites are diminishing; incineration faces th problem of the high cost of fuel and air pollutio control equipment. New methods of disposal bein investigated are co-incineration and co-pyrolysi of sludge with solid wastes. (See also W75-09532 (Prague-FIRL)
W75-09533

**ALTERNATIVE METHODS FOR SLUDGE MANAGEMENT,**
Environmental Quality Systems, Inc., Rockville Md.
H. Bernard.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 11-20, 1974. 4 fig, 4 tab, 6 ref.

Descriptors: *Environmental effects, *Sludge disposal, *Sludge treatment, *Waste water treatment, Costs, Computer models, Sewage treatment, Management.
Identifiers: Disposal alternatives.

The holistic environmental viewpoint is considered in alternatives for sludge handling and disposal from waste water treatment plants. Computer methods can be used to consider economic alternatives, such as costs of power, chemicals, or transportation, coupled with emissions standards and availability of land. The sludge processing system involves both treatment of a liquid phase and treatment of a solid phase. While separated solids from sewage treatment is about 0.5 percent of the total liquid phase volume, sludge disposal has the disproportionate cost of about 30 to 50 percent of the total costs associated with waste treatment. Sludge disposal itself is often considered only after final stages of plant design are complete. Suggested for the determination of sludge management alternatives is a consideration of socio-economic-environmental factors. These are: energy, air pollution, land use, resource recovery, public attitudes, secondary impacts, surface water quality, nitrogen impact, soil pollution, cropping practices, economic impact, social requirements, and ecological impacts. Disposal alternatives of incineration, land disposal, recovery and sale, and composting are described. (See also W75-09532) (Prague-FIRL)
W75-09534

**THICKENING OF SLUDGES,**
Delaware Univ., Newark. Dept. of Civil Engineering.
R. I. Dick.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 21-28, 1974. 5 fig, 13 ref. OWRT A-025-DEL(1).

Descriptors: *Sludge treatment, *Sludge disposal, Mathematical models, Costs, Settling, Waste disposal, Waste water treatment.
Identifiers: *Cost effectiveness, Thickening, *Sludge thickening.

While thickening is involved in any system of sludge treatment and disposal, rational approaches to the design and operation of thickeners for an optimal degree of thickening have not been traditionally implemented. This optimal degree of thickening has a significant effect on the total cost of sludge treatment and disposal, because cost effectiveness is dependent upon the concentration of solids in the sludge. Traditionally, thickeners have been sized arbitrarily without regard to the thickening properties of the sludge being treated. However, the size of a thickener does affect the amount of thickening achieved. Size can be computed or estimated if the settling characteristics of the sludge are known. The degree of concentration of sludge depends upon nature of the sludge, size of the community, and types of other sludge treatment and disposal involved in the same system. Rational analyses to determine potential cost reductions are illustrated. These integrate the design of the thickeners with the design of other processes. (See also W75-09532) (Prague-FIRL)
W75-09535

**ANAEROBIC DIGESTER OPERATION AT THE METROPOLITAN SANITARY DISTRICTS OF GREATER CHICAGO,**
Metropolitan Sanitary District of Greater Chicago, Ill.
S. P. Graef.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 29-35, 1974. 9 tab.

Descriptors: *Anaerobic digestion, *Sludge treatment, *Municipal wastes, Construction costs, Digestion, Operating costs, Sludge disposal, *Illinois, Waste water treatment.
Identifiers: *Chicago(Ill), Thickening, *Sludge thickening.

Anaerobic sludge digestion as utilized by the Metropolitan Sanitary District of Greater Chicago is summarized. The capacities of five digestion facilities are compared. Discussed also are digester construction costs, operation and maintenance costs, sludge conditioning and digester flow regimes, heat transfer, loading intensity, gas production, digested sludge characteristics, sludge disposal, and digester problems. Problems, such as thickening, clogging, foaming, gas recirculation, and supernatant separation have been solved. Bench and pilot scale research indicates that future improvements are possible. These include: shorter residence times, resulting from more homogeneous feed sludges, improved flow regimes and more frequent sludge analysis; uniform digester feeding and withdrawal accomplished by automatic mass balance control; on-line measurement of process stability indicators such as the rate of methane production; and, digester gas scrubbing in order to produce a cleaner fuel of higher BTU value, to reduce gas recirculation compressor fouling, and to provide pH control by removing the weak carbonic acid, rather than adding a base. As a means for sludge processing, anaerobic digestion should continue to be a viable method for the treatment of municipal sludges. (See also W75-09532) (Prague-FIRL)
W75-09536

**METRO DENVER'S EXPERIENCE WITH LARGE SCALE AEROBIC DIGESTION OF WASTE ACTIVATED SLUDGE,**
Metropolitan Denver Sewage Disposal District No. 1, Commerce City, Col.
D. B. Cohen.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 37-53, 1974. 7 fig, 5 tab, 11 ref.

Descriptors: *Aerobic treatment, Aeration, Digestion, Pilot plants, Oxygen, Biological treatment, *Waste water treatment, *Activated sludge, Colorado.
Identifiers: *Denver(Colo), Aerobic digestion, Rotary diffusers, Waste activated sludge.

In 1970, the Metropolitan Denver Sewage District No. 1 (Metro) converted excess secondary aerators to aerobic digestors in two steps. The first part involved plant scale aerobic digestion of dilute W.A.S. in four converted secondary aeration basins. The second part involved extensive research and development to compare pilot open tank oxygen systems using both slot and rotating diffusers with this plant scale system. V.S.S. reductions ranged between 11.2% and 47.2% for the air system. A correlation between V.S.S. reduction and S.R.T. x temperature was shown to be significant. When invertebrates (especially rotifers) comprised a significant fraction of the biomass, digestion was maximum. No correlation between dissolved oxygen concentration and V.S.S. digestion rates was observed. At loadings greater than 0.14 pounds V.S.S. per cu ft per day, oxygen performance is superior. Aerobic digestion reduced sludge disposal costs. The Denver Sewage Disposal District (Metro) is now planning to convert a one million gallon tank to an oxygen aerobic digester with rotary diffusers. **HIGH PURITY OXYGEN AEROBIC DIGESTION EXPERIENCES AT SPEEDWAY, INDIANA,**
Union Carbide Corp., Tonawanda, N.Y. Linde Div.
D. W. Gay, R. F. Drnevich, E. J. Breider, and K. W. Young.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 55-66, 1974. 6 fig, 7 tab, 8 ref.

Descriptors: *Aerobic treatment, *Oxygen, *Waste water treatment, Microorganisms, Treatment facilities, Clarification, Costs, *Indiana.
Identifiers: Speedway(Ind), UNOX, *Aerobic digestion, High purity oxygen.

Aerobic digestion stabilizes primary waste and/or waste activated sludge through the catabolism of aerobic microorganisms. At the Speedway Indiana Water Pollution Control Plant, a full scale aerobic digestion study was performed, using high purity oxygen. The goal was to examine the possibility of attaining and operating at elevated temperatures without an external heat source. The facility's existing UNOX system was modified; the entire waste water flow from its primary clarifier was handled by one of two reactor trains while the other train served as an aerobic digestion unit. During winter operation, the oxygen aerobic digestion was capable of sustaining high (greater than 31C) temperatures by the conservation of energy produced by endogenous decay. Data obtained were used to design a full scale aerobic digestion system for Speedway, Indiana. The annual cost for digestion of waste sludge is $53,400, or the equivalent of $34.00 per ton of dry solids treated. (See also W75-09532) (Prague-FIRL)
W75-09538

**SLUDGE DEWATERING,**
Los Angeles County Sanitation Districts, Whittier, Calif.
C. W. Carry, R. P. Miele, and J. F. Stahl.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 67-76, 1974. 5 fig, 2 tab.

Descriptors: *Dewatering, *Sludge treatment, *Suspended solids, Centrifuges, Sanitary landfills, Sludge disposal, Pilot plants, Conditioning, Costs California, *Waste water treatment.
Identifiers: *Los Angeles(Calif), Waste discharge, Sludge dewatering.

Since April 1970 a sludge dewatering investigation was performed by the Los Angeles County Sanitation District and their 380 mgd Joint Water Pollution Control Plant. The Los Angeles Regional Water Quality Control Board had set new discharge requirements that a minimum of 95 percent of the suspended solids in digested sludge be removed. Pilot plant studies showed that five conditioning-dewatering systems were capable of meeting these discharge requirements. An economic evaluation of each alternative was made, assuming a solids quantity of 390 tons per day. The result was the selection of a two stage centrifugation system. The system uses existing horizontal scroll centrifuges followed by imperforate bowl basket centrifuges. In addition, cationic polymers in the dosages of 4 lb/ton were added to the influent of the second stage unit. The composite cake from both units will be hauled by truck to a sanitary landfill. Costs of the total system are predeicted to be $36.40 per ton. (See also W75-09532) (Prague-FIRL)
W75-09539

**PRESSURE FILTRATION--MUNICIPAL WASTEWATER SOLIDS, CEDAR RAPIDS, IOWA,**
Green (Howard R.) Co., Cedar Rapids, Iowa.
J. W. Gerlich.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 77-85, 1974. 5 fig, 1 tab.

Descriptors: *Filtration, *Dewatering, *Sludge treatment, Conditioning, Costs, Fly ash, Filtrate, Iowa, Waste water treatment.
Identifiers: Pressure filtration, Cedar Rapids(Iowa), Filter cakes.

Cedar Rapids, Iowa has the first major installation in the United States using the pressure filter for its dewatering process. In pilot dewatering studies fly ash was effective in reducing chemical conditioning costs from twenty to four dollars per ton of dry solids. A nine month study evaluated full scale plant performance where sludge cake incinerator ash was utilized as a conditioning agent. Economic evaluation found that the process offered a distinct advantage over other forms of sludge dewatering for Cedar Rapids' sludge. Cake quality on the full scale plant was maintained over a broader range of solids concentrations than was expected. The product of pressure filtration is an increase in solids concentration in the cake with a decrease in suspended solids content in the filtrate. Advantages of pressure filtration include: quantities of sludge conditioners are usually reduced; filtration efficiency is maintained for a broad range of sludge characteristics; solids content of the filter cake is increased; filtrate suspended solids and BOD are very low; operation and manpower requirements are minimal; and cake disposal is convenient due to lower moisture and smaller volumes. W75-09540

**HEAT TREATMENT AND INCINERATION,**
Dorr-Oliver, Inc., Stamford, Conn.
D. T. Mayrose.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 87-91, 1974. 4 fig, 3 tab, 1 append.

Descriptors: *Heat treatment, *Incineration, *Dewatering, Sludge treatment, Biological treatment, Waste treatment, *Waste water treatment.
Identifiers: Sludge cakes.

Heat treatment, in combination with dewatering, is one alternative for treatment of municipal sludge. Waste sludges are heated to 400 F, and this temperature is maintained for about thirty minutes. A sludge is produced with greatly improved dewaterability characteristics. Illustrations compare dewatering heat treated sludge and chemically conditioned sludge. Advantages of heat treatment over raw chemically conditioned sludge include: twice the cake solids concentration in the dewatering unit is possible with heat treatment, as well as double the cake solids capacity of the dewater device; significant reduction or elimination of chemical condition agents can be achieved; when combined with combustion, a smaller incinerator can be used due to lower feed cake water content; and, no fuel will normally be needed for incineration due to the ratio of volatile matter to water in the dewatered heat treated sludge. The process of incineration of biological sludges is also discussed. This may be used alone or in combination with heat treatment. When used together, heat treatment and incineration improve the economics of sludge disposal by improving dewaterability as well as reducing or eliminating chemical conditioning agents and the need for auxiliary fuel. **GROWTH OF BARLEY IRRIGATED WITH WASTEWATER SLUDGE CONTAINING PHOSPHATE PRECIPITANTS,**
National Environmental Research Center, Cincinnati, Ohio.
M. B. Kirkham, and G. K. Dotson.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 97-106, 1974. 9 tab, 16 ref.

Descriptors: *Irrigation, *Sludge, *Phosphates, *Fertilizers, Agriculture, Barley, Lime, Alum, *Sludge treatment, *Waste water treatment, Water reuse.
Identifiers: Ferric chloride.

It has been unclear as to whether wet sludges containing precipitated phosphates can be used agriculturally. To investigate the use of chemically-treated sludges, barley was grown for 16 weeks in pots of loam soil, and was then irrigated for 7 weeks with wet sludges. Raw primary sludge and primary sludges from alum and ferric chloride addition to raw waste water, either limed or unlimed, were added at two different rates. The rates corresponded to a total application of 23 or 46 m tons/ha/yr. The total and extractable phosphorus in the soil and the elemental composition of the plants were determined. Barley plants irrigated with three types of sludges grew as well as those supplied with inorganic fertilizer. However, fertilized plants yielded more grain than sludge-treated plants. Liming significantly decreased extractable phosphorus only in the iron-treated soil. Ninety-two percent of the phosphorus added by the sludges remained in the sludge crust throughout the experiment. On a short-term basis, for growing barley, it was shown that the presence of phosphate precipitated by Al or Fe did not limit growth and that sludges containing phosphate precipitants may be used. **THE ECONOMICS OF SLUDGE IRRIGATION,**
Springfield Sanitary District, Ill.
A. P. Troemper.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 115-121, 1974. 5 tab.

Descriptors: *Sludge disposal, *Sewage treatment, *Irrigation, Liquid wastes, Drainage, Planning, Design criteria, Anaerobic digestion, Waste water treatment, *Costs, Illinois, Water reuse.
Identifiers: Waste discharge, Spray irrigation, Springfield(Ill).

Discharge of liquid anaerobically digested sludge to an experimental plot was begun in 1965 by the Springfield, Illinois Sanitary District. Irrigation continued through 1971, with crops being planted both on the sewage treated area and on a control area. Costs and benefits in terms of crop yield for each season are enumerated. It was concluded that irrigation on cropland with liquid digested sludge is a valid disposal method for municipal sludge. Spray irrigation was the most practical method of application, although wind drift must be taken into account. Given a sufficient amount of land, the method is economically competitive with alternative methods of disposal. The operation requires minimal attention and creates no odor nuisance, so long as the sludge is reasonably well digested. In designing a system for liquid sludge disposal, a permanent disposal area with a sloped distribution system will allow operation in severe winter months without additional problems; with provision of a good underdrainage system, the possibility of groundwater contamination is minimized. **COMPOSTING SEWAGE SLUDGE,**
Agricultural Research Service, Beltsville, Md. Biological Waste Management Lab.
E. Epstein, and G. B. Willson.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 123-128, 1974. 3 fig, 1 tab, 5 ref.

Descriptors: *Sewage sludge, *Fertilizer, Sludge disposal, *Waste water treatment, Costs, Digestion, Public relations, Planning, Odors, District of Columbia.
Identifiers: *Composting, Blue Plains(Washington DC).

The composting of sewage sludge was investigated at a pilot plant at the Blue Plains Wastewater treatment plant in Washington, D.C. Sewage sludge has seldom been composted by itself, and various types of bulking agents were tested in order to determine which materials and in what ratio to the sludge gave the desired density and moisture content. The optimal bulking agent was wood chips, incorporated with sludge at a ratio of 3:1. The operation of the composting site at Beltsville, Maryland is detailed. Two major operational problems were how to compost digested sludge under adverse weather conditions and how to compost raw sludge without odors. The addition of material such as chopped hay, straw, or shredded paper to digested sludge accelerates its composting. Further research is being done on odor prevention, using microbiological, chemical, and mechanical methods. Efficient management and coordination between the sewage treatment plant and the composting site is necessary. A public relations program is important. Direct cost-benefit relationships have not been computed; the composting of sewage sludge now has the goal of reducing sludge disposal costs from waste water treatment plants rather than being a profit-making venture. **PASTEURIZATION OF LIQUID DIGESTI SLUDGE,**
Cincinnati, Ohio National Environmen Research Center.
G. Stern.
In: Municipal Sludge Management, Proceedings the National Conference on Municipal Slud Management, June 11-13, 1974, Pittsburg Pennsylvania, p 163-169, 1974. 1 fig, 4 tab, 7 ref.

Descriptors: *Sludge disposal, *Pathogen *Pasteurization, Sludge treatment, Digestio Viruses, Bacteria, Public health, Laboratory test Soils, *Waste water treatment.
Identifiers: *Land application, Liquid digeste sludge.

Liquid digested sludge, when applied to land f final disposal, may contain pathogens such viruses, bacteria, cysts or oocysts or protozoa an worm eggs. There is no evidence that stabilize sludges have caused disease to man or animal However, concern of health officials that thes pathogens be completely destroyed has led laboratory investigations of pasteurization liquid digested sludge as a method of disinfectio In West Germany, pasteurization is used whe sludge is spread during the summer growth seaso The National Environmental Research Center i Cincinnati, Ohio, tested pasteurizatio time/temperature relationships, types and amour of fuel sources and heat required, the transfer an dispersion of heat with liquid sludge, types o equipment, and estimated costs of the pasteuriza tion methods. It was concluded that pasteurizatio at 70 C for 30 to 60 minutes destroys pathogens ef fectively. Methane gas from anaerobic digestion i available as a fuel source, with direct steam injec tion and efficient mixing of steam and liqui sludge recommended. The costs were about te dollars per ton of sludge solids for small plants Studies also showed that pasteurized sludge can b applied to growing lawn grasses as long as th sludge has been cooled to 60 C at the soil surface (See also W75-09532) (Prague-FIRL)

**SLUDGE HANDLING AND DISPOSAL AT BLUE PLAINS,**
District of Columbia Dept. of Environmental Services, Washington.
A. F. Cassel, and R. T. Mohr.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 171-176, 1974. 3 fig, 3 tab.

Descriptors: *Sludge treatment, *Sludge disposal, Treatment facilities, Land use, Dehydration, Incineration, Guidelines, Fertilizer, Energy, Pilot plants, District of Columbia, *Waste water treatment.
Identifiers: *Composting, Blue Plains Treatment Plant(Washington DC), Land application, Thermal dehydration.

Problems of sludge handling and disposal at the Blue Plains Wastewater Treatment Plant in the Washington, D.C. area are described. The plant is currently being expanded with the addition of advanced waste water treatment. Both raw and digested sludge undergo disposal by a variety of techniques including land spreading, burial, composing,d thermal dehydration. New alternatives, including the processing of sludge into a reusable commodity, are being studied. A multi-faceted disposal method that is not totally subject to weather or to biological and chemical upsets is described. Options to consider for future sludge disposal are: all raw sludge disposal, thermally dehydrated, marketed as fertilizer; a combination of raw sludge which is thermally dehydrated for fertilizer and digested sludge disposal of on land or composted, wherby methane from the digestion is used as fuel for drying; a combination of raw sludge which is incinerated with digested sludge disposed of on land or composted; and the incineration of completely raw sludge. These options will be tested by an EPA-D.C. pilot plant, taking into account factors of energy availability as well as specific problems of each alternative method. (See also W75-09532) (Prague-FIRL)

**ENERGY CONSERVATION AND RECYCLING PROGRAM OF THE METROPOLITAN SEWER BOARD OF THE TWIN CITIES AREA,**
Metropolitan Sewer Board, St. Paul, Minn.
D. C. Bergstedt.
In: Municipal Sludge Management, Proceedings of the National Conference on Muncipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 187-194, 1974. 8 fig.

Descriptors: *Energy *Sewage treatment, *Sludge treatment, Sludge disposal, *Recycling, Conservation, Treatment facilities, Incineration, Equipment, Operation, Fertilizers, Water reuse, Minnesota, *Waste water treatment.
Identifiers: Sludge recycling, St. Paul(Minn), Minneapolis(Minn).

Recent actions of the Metropolitan Sewer Board of the Twin Cities Area in response to the 1973 energy problems are described. The Board is the regional treatment authority for waste water in the area of Minneapolis and St. Paul, Minnesota and operates 24 treatment plants. Ten major programs have been instituted related to energy saving and recycle, without detriment to the quality of waste water treatment. Major changes include: pyrolysis of municipal refuse to furnish heat value for sludge drying; recovery and beneficial use of heat in exhaust gases from incinerators; continuous pressure dewatering; flameless odor control; and improved results by the modification of existing sludge processing equipment. Additionally, the operations include manufacture of fuel-grade sludge cake and char; preparation of fertilizer, soil conditioner and recyclable metal scrap; use of solid fossil fuel, such as coal, to augment combustion in incinerator furnaces; manufacture of activated carbon for in-plant use; and pulping of refuse fibers for use as filter aid. The important factor in choice of these alternatives for energy conservation and recovery is the reliability of a chosen method. (See also W75-09532) (Prague-FIRL)

**SLUDGE DISPOSAL AT A PROFIT,**
Barber-Colman Co., Irvine, Calif. Resource Recovery Systems Div.
W. M. Fassell.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 195-204, 1974. 7 fig, 6 tab, 16 ref.

Descriptors: *Oxidation, *Sludge disposal, *Sludge treatment, Costs, Energy, Thermal energy, Organic compounds, Recycling, Waste water treatment.
Identifiers: *Wet oxidation system, PURETEC/WETOX System.

The application of hydrometallurgical wet oxidation practice to the destruction of sewage sludge has been investigated. The PURETEC/WETOX Process uses an agitated horizontal, multiple-compartment autoclave. The reactor operates under mildly acid conditions and achieves 75 to 85 percent destruction of the COD in any sewage sludge at 440 to 465 F and 600 psi. Substantial quantities of thermal energy are generated; nitrogen compounds are converted to ammonia which is recoverable. Metals, which now are in short supply, are extractable. The predominant organic compound in the resultant solution is acetic acid, which may be used as a carbon source for denitrification. Economic evaluations of the PURETEC/WETOX system are given, in theory, for Philadelphia and for the Blue Plains Wastewater Treatment Facility (Washington, D.C.). With credits for reusable materials as by-products of the system from the traditional sludge disposal costs of $25 to $47/ton may be reduced to between $10/ton and a theoretical net operating costs. Within the next calendar year, pilot plants for large scale demonstration of the wet oxidation system will be in operation. (See also W75-09532) (Prague-FIRL)
W75-09557

**SLUDGE MANAGEMENT SYSTEM FOR ST. LOUIS,**
Saint Louis Metropolitan Sewer District, Mo.
P. F. Mattei.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 205-210, 1974.

Descriptors: *Sludge treatment, Watersheds(Basins), *Anaerobic digestion, Incineration, Tertiary treatment, Vacuum filtration, Storage, Treatment facilities, *Waste water treatment.
Identifiers: *Land requirements, Solids handling, St. Louis(Mo).

Two types of solids handling systems of the Metropolitan St. Louis Sewer District, each for a major subdistrict, are described. The two systems are based on the individual needs to their watersheds. Anaerobic digestion with storage basins was chosen for a secondary treatment plant at Coldwater Creek. The plant services an area of 41 square miles, with a design average flow of 25 mgd. The two Mississippi River subdistrict plants--Lemay and Bissell Point--provide primary treatment for an average design flow of 424 mgd and serve a watershed of 196 square miles. Vacuum filtration, incineration and ash storage basins were selected for these larger subdistrict plants. Because of the disposal methods chosen for Lemay and Bissell point, the land requirement was significantly reduced. The smaller plant at Coldwater Creek, on the other hand, had adequate land for storing digested sludge, and methane gas from the digestion process provided energy to drive blowers and pumps at an economic cost for the secondary treatment process. Each system is well-adapted to its individual watershed location. (See also W75-09532) (Prague-FIRL)

**PHOSPHORUS REMOVAL STUDY AT THE SARNIA WPCP,**
Ontario Ministry of the Environment, Toronto.
I. M. Gray.
Environment Canada, Centre for Inland Waters, Burlington, Ontario. Canada-Ontario Agreement on Great Lakes Water Quality, Research Report No 14, (1974). 20 p, 7 fig, 3 tab, 71-2-1.

Descriptors: *Sludge treatment, *Treatment facilities, *Waste water treatment, Jar tests, Hydraulics, Phosphorus, *Canada.
Identifiers: *Sarnia Water Pollution Control Plant(Ont), *Phosphorus removal, *Ferric chloride.

A research project was conducted at the Sarnia Water Pollution Control Plant from January to June, 1972 to investigate: the effects of ferric chloride dosage, mixing, and hydraulics on the removal of total phosphorus in a primary waste water treatment plant; and, the effects of ferric chloride addition for phosphorus removal on the anaerobic sludge digestion process. The investigation followed a jar test study and a temporary full scale phosphorus study using ferric chloride, which had been conducted previously by the Dow Chemical Company of Canada, Limited. Existing facilities at the Sarnia WPCP are described, and the average process and analytical data obtained are presented. Effects of various dosages of ferric chloride, with and without the addition of polymers, under various mixing and primary clarifier hydraulic conditions are discussed, in terms of phosphorus removal and other effluent quality parameters. Similarly, the effects of the chemical addition on sludge production and anaerobic sludge digestion are presented. (Prague-FIRL)
W75-09562

**PHOSPHORUS REMOVAL IN SEASONAL RETENTION LAGOONS BY BATCH CHEMICAL PRECIPITATION,**
Ontario Ministry of the Environment, Toronto.
H. J. Graham, and R. B. Hunsinger.
Environment Canada, Centre for Inland Waters, Burlington, Ontario. Canada-Ontario Agreement Research Report No 13, (1974). 40 p, 15 fig, 4 tab, 14 ref. 73-1-13.

Descriptors: *Phosphorus, *Nutrient removal, *Waste water treatment, *Precipitation(Chemical), *Water pollution treatment, Chemicals, Sewage treatment, Municipal wastes, Industrial wastes, Coagulation, Lagoons, Lime, *Canada.
Identifiers: *Batch treatment, Alum, Ferric chloride, Ontario, Phosphorus removal.

A result of a Province of Ontario policy requiring phosphorus removal at municipal and institutional waste water treatment facilities in certain areas of the province is the development of a method of reducing the total phosphorus content in waste stabilization pond effluents to below 1.0 mg/liter. The method of achieving this in seasonal retention lagoons is through batch chemical treatment of the pond contents prior to discharge. Three prime coagulants, alum, ferric chloride, and lime were field tested. The required chemical dosage was determined by jar tests using lagoon contents. Batch chemical treatment of seasonal retention lagoons can produce total phosphorus residuals of less than 1.0 mg/liter. The quality of the effluent from a batch treated lagoon is at least as good as that achieved through conventional secondary treatment. Batch treatment can effectively remove algae from the pond contents if the chemical dosage is sufficient. Liquid alum and ferric chloride both produced a high quality effluent. Inconsistent results were obtained from the lime applications. Good dispersal of the chemical and adequate mixing with the pond contents can be accomplished with an outboard motorboat method of application. Batch chemical treatment is feasible on many existing lagoons that have an adequate retention time for winter storage. Some single and large cells can also be batch treated but lagoons built specifically for batch treatment ensure ease of operation. In five successive treatments of one lagoon, the dosage required for adequate phosphorus removal did not increase and there was only a slight increase in the sediment depth with each treatment. (Orr-FIRL)
W75-09563

**IDENTIFICATION OF PROBLEM AREAS IN WATER POLLUTION CONTROL PLANTS,**
Ontario Ministry of the Environment, Toronto.
K. M. Azan, and B. I. Boyko.
Environment Canada, Centre for Inland Waters, Burlington, Ontario, Canada-Ontario Agreement on Great Lake Water Quality, Research Report No 15, (1974). 41 p, 12 fig, 5 tab, append. 73-1-27.

Descriptors: *Water pollution control, *Treatment facilities, *Canada, Flow measurement, Surveys, Design criteria, Personnel, *Waste water treatment.
Identifiers: *Ontario(Canada), Hydraulic overloading.

Problem areas commonly encountered in waste water treatment facilities were determined from responses of Water Pollution Control Plant operators to a questionnaire circulated to 162 WPCP's in Ontario. Overall responses indicated that the major problem area in WPCP operation is hydraulic overloading. The incidence of hydraulic overloading is independent of plant size; a significant percentage of plants constructed in the last five years are overloaded. Hydraulic overloading affects pumping capacity, grit removal and secondary clarifier operation. Responses also indicated a general need for additional flow measurement devices. In addition, a considerable need for further operator education in plant testing procedures, interpretation and application of laboratory results, waste water treatment processes, safety, and equipment repair. (Prague-FIRL)
W75-09564

**WET AIR OXIDATION OF CHEMICAL SLUDGES,**
Waterloo Univ. (Ontario). Dept. of Chemical Engineering
R. R. Hudgins, and P. L. Silveston.
Environment Canada, Centre for Inland Waters, Burlington, Ontario. Canada-Ontario Agreement Research Report No 12, March, 1973. 79 p, 7 fig, 6 tab, 23 ref, 5 append.

Descriptors: *Waste disposal, *Sludge disposal, *Oxidation, Phosphorus, Chemical reactions, *Waste water treatment, Sewage treatment, Municipal wastes, Canada, Foreign research, *Sludge treatment.
Identifiers: *Wet air oxidation.

The Zimmerman process, also called Wet Air Oxidation, or wet oxidation was developed over 20 years ago as a technique for waste disposal. Wet air oxidation was performed on eight Ontario sludges containing phosphorus. Some of the sludges were obtained from primary or secondary clarifiers in which lime, ferric chloride, or alum had been added to precipitate phosphorus. The sludges were oxidized at temperatures up to 550 F in a rocking autoclave; total carbon and total organic carbon values were measured in samples taken during oxidation. Selected total phosphorus and ortho-phosphorus analyses were made on both chemical and non-chemical sludges. For most sludges at 500 F, a reduction of at least 50% of the TOC was produced by 3 hours exposure to wet air oxidation. Mass transfer limitations seemed to be present except in the case of the activated sludges. Cations from chemical stabilization of phosphorus seem to catalyze wet air oxidation. The stabilization of phosphorus by prior chemical treatment was slightly reversed by wet air oxidation of the chemical sludges. Contradictory evidence of increased and reduced stabilization resulting from wet air oxidation of non-chemical sludges illustrates the need for further studies. Sludges containing high levels of chemicals may cause carbonate formation during sludge oxidation. Recovery of a high yield phosphorus in the form of a residual ash from wet oxidation appears feasible. Further studies are needed to establish the kinetics of wet air oxidation more fully and to provide knowledge of the reasons for changes in solubility during the process. (Orr-FIRL)
W75-09565

**PROCESS FOR THE REDUCTION OF THE BIOCHEMICAL OXYGEN DEMAND OF SEWAGE AND FOR THE RECOVERY OF THE INHERENT PROTEIN,**
J. Hollo, J. Toth, and I. Zagyvai.
Canadian Patent 959,586. Patent Office Record, Vol 102, No 51, p 83, December, 1974.

Descriptors: *Sewage treatment, *Patents, *Biochemical oxygen demand, *Proteins, Polymers, Hydrogen ion concentration, Dewatering, Alum, Iron, Chemical precipitation, *Waste water treatment.
Identifiers: Copolymers, Dehydration, Protein recovery.

A process for the reduction of BOD of sewage is described in which the inherent protein is recovered. Sewage is purified by adding to it at least 120 g/cu m of a water-soluble aluminum salt or a bivalent or trivalent iron salt, and possibly 0.5 to 1.0 kg/cu m of bentonite or kaolin, as well as five to ten g/cu m of copolymers of acrylic acid - acrylic amide in the form of an aqueous solution. Sewage is then conditioned, its pH is adjusted to exceed ten by adding a basic calcium compounds, and the protein-containing precipitate thus obtained is separated from the clarified water in a settling tank. The pH of the precipitate is adjusted to seven or less using carbon dioxide. After dehydration the precipitatate may be sterilized at temperatures above 130 C under pressure. (Prague-FIRL)
W75-09566

**WASTEWATER TREATMENT SYSTEM,**
F. A. Karr.
Canadian Patent 959,182. Issued December [illegible] 1974. Patent Office Record, Vol 102, No 50, p [illegible] December, 1974

Descriptors: *Patents, *Waste water treatment, *Oxygen, Sumps, *Biological treatment, Bacteria, Identifiers: Oxygen injection, Bacterial treatment.

An apparatus and method are described for injecting air or other oxygen-containing gases under pressure into waste water from within a gas porous shell capable of passing gas bubbles of a size for retention by the waste water. The injection may be through elements at the bottom of a sump or in stream in a recycle line to and from the sump. The bed of perforate balls on the bottom of the sump provides an excellent surface area for bacterial treatment by coated enzymes injected into the system. (Prague-FIRL)
W75-09567

**WASTEWATER TREATMENT SEQUENCE,**
M. Zuckerman, and A. Molof.
Canadian Patent 957,789. Issued November [illegible] 1974. Patent Office Record, Vol 102, No 46, p [illegible] November, 1974.

Descriptors: *Patents, *Waste water treatment, *Pre-treatment, *Hydrolysis, Biological treatment, Organic matter, Filtration, Membranes, Disinfection.

An improved process for treating waste water based on pretreatment by hydrolysis. This converts high molecular weight soluble organic material in raw waste water into organic matter of low molecular weight. Following this conversion, the waste water is treated with a process sequence tailored to effluent quality requirements. One such sequence may include, for example, the steps of physical or biological adsorption, solids removal, membrane filtration, and disinfection. (Prague-FIRL)
W75-09569

**SEWAGE TREATMENT WITH PRIMARY SLUDGE REMOVAL FROM FINAL CLARIFIER,**
J. D. Walker.
Canadian Patent 959,584. Issued December [illegible] 1974. Patent Office Record, Vol 102, No 51, p [illegible] December, 1974.

Descriptors: *Sewage treatment, *Sludge treatment, *Patents, Settling basins, Tanks, Aeration, Clarification, Sludge disposal, *Waste water treatment.
Identifiers: Settling tanks, Clarification tanks.

A method of sewage treatment with primary sludge removal from a final clarifier is described. The primary settling tank is omitted or reduced in size; the primary type of sludge is carried through the aeration tank by vigorous circulation of its contents, then removed from the system at the final clarification tank. Sludge settles on the floor near the entry to the clarifying area and is scraped separately into a hopper as waste sludge. All sludge settling further remote from the feed is removed from several points for rapid return of a portion to the aeration tank. The reduction of primary settling provides an inventory of fine inert particles. In the aeration tank, these particles adhere to the light activated sludge flocs to increase their weight and aid settling in the clarification tank. (Prague-FIRL)
W75-09570

**WET OXIDATION TREATMENT OF WASTE LIQUOR OR SLUDGE,**
L. A. Pradt.
Canadian Patent 958,507. Issued December 3, 1974. Patent Office Record, Vol 102, No 49, p 2, December, 1974.

Descriptors: *Patents, *Waste water treatment, Oxidation, Waste treatment, *Sewage treatment, Tanks, Sludge treatment, Industrial wastes, Oxidation.
Identifiers: *Wet oxidation, Flash tanks.

Wet oxidation treatment of waste liquor or sludge is described. Raw liquor or sludge derived from either sewage or industrial wastes is introduced to a heat exchanger. It then proceeds through a temperature control valve to a reactor, and to a separator. A flash tank receives oxidized liquor from the separator; another flash tank receives oxidized liquor from the separator at an intermediate pressure. This results in flash steam used for indirect preheating of the liquor or sludge by the heat exchanger in a single stage. (Prague-FIRL)
W75-09571

**BIOLOGICAL AERATED FILTERS,**
J. Tymoszczuk.
Canadian Patent 953,039. Issued August 13, 1974. Patent Office Record, Vol 102, No 33, p 85, August, 1974.

Descriptors: *Filters, *Patents, *Aeration, Domestic wastes, Industrial wastes, *Waste water treatment, Water pollution, Effluents.
Identifiers: *Biological aerated filters.

A process for the treatment of domestic and industrial wastes was a submerged biological filter bed of finely divided particulate filtering media. The wastes enter the biological filter bed and the filter is aerated during the filtration process. Treated effluent is drawn out of the biological filter bed; the bed is backwashed as often as necessary to maintain operating efficiency. The process is different from other processes because of the maintenance of a submerged and aerated filter bed. (Leibowitz-FIRL)
W75-09572

**PROCESS FOR THE RECOVERY OF FORMALDEHYDE AND PHENOL CONTAINED IN WASTE WATERS,**
H. Ackermann, G. Minore, and P. Radici.
Canadian Patent 963,592. Issued February 25, 1975. Patent Office Record, Vol 103, No 8, p 86, February, 1975.

Descriptors: *Patents, *Waste water treatment, Phenols, Water reuse, Ammonia, Liquid wastes, Recycling, Water purification, Industrial wastes.
Identifiers: *Formaldehyde, Waste liquors.

In a process for the purification of waste liquors, formaldehyde and phenol are recovered from the liquors. Ammonia is added to the formaldehyde liquor, to form hexamethylene tetramine. Water is evaporated and the concentrate is added to the phenol liquor, thus recovering the hexamethylene tetramine/phenol adduct formed. (Prague-FIRL)

**STORM WATER MANAGEMENT MODEL: USER'S MANUAL, VERSION II,**
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
W. C. Huber, J. P. Heaney, M. A. Medina, W. A. Peltz, and H. Sheikh.
Available from the National Technical Information Service, Springfield, Va. 22161. Environmental Protection Agency, Report EPA-670/2-75-017, March 1975, 350 p, 42 fig, 90 tab. 1BB034; ROAP 21ATA; Task 022. R-802411.

Descriptors: *Water quality, Runoff, Storm sewers, *Sewers, *Urbanization, Stream pollution, Estuaries, *Mathematical models, Water storage, Water pollution, *Waste water treatment, Surface runoff, Soil erosion, Drainage, Cost analysis, Hydraulics, *Combined sewers, Model studies, Computer models, Overflow, Storm water.
Identifiers: *Urban runoff modeling, *Optimum design, Lancaster(Pa), St Johns River(Fla).

A comprehensive mathematical model (the EPA Storm Water Management Model, SWMM) capable of representing urban stormwater runoff and combined sewer overflow phenomena was developed. SWMM portrays correctional devices in the form of user-selected options for storage and/or treatment with associated estimates of cost. Effectiveness is portrayed by computed treatment efficiencies and modeled changes in receiving water quality. The original project report published in 1971 is divided into four volumes: Volume I, 'Final Report'; Volume II, 'Verification and Testing'; Volume III, 'User's Manual'; and Volume IV, 'Program Listing' (EPA Report Nos 11024DOC07/71, 11024DOC08/71 11024DOC09/71, and 11024DOC10/71, respectively). (See also W71-13370). Effort on modification and improvement of the SWMM has been, and is being continued since its release. As a result, this official 'Release 2' of the SWMM includes additional program components, i.e., new runoff routine, urban erosion prediction, new treatment process performance and cost functions, and new receiving water quality. This report provides a revised and improved User's Manual to accompany 'Release 2' as in the original User's Manual, Volume III. (EPA)

**COUNTERMEASURES FOR POLLUTION FROM OVERFLOWS; THE STATE OF THE ART,**
Environmental Protection Agency, Edison, New Jersey, Storm and Combined Sewer Section.
R. Field, and J. A. Lager.
Available from the National Technical Information Service, Springfield, Va. 22161. Report EPA-670/2-74-090, December 1974. 30 p, 4 fig, 2 tab, 28 ref. 1BB034/ROAP 21ASY/TASK 01. EPA Contract 68-03-0179.

Descriptors: Disinfection, *Waste treatment, *Sewage treatment, Sewage, Water quality, Cost effectiveness, Storage tanks, *Storm sewers, *Overflows, *Combined sewers, Mathematical models, Storm runoff, Drainage systems, Water pollution control, Pollution abatement, *Storm runoff, *Waste water treatment, *Urban hydrology.

Control and/or treatment of stormwater discharges and combined sewage overflows from urban areas are important problems in the field of water quality management. Over the past decade much research effort has been expended and a large amount of data has been generated. Presented are selected results of a comprehensive investigation and assessment of promising, completed and ongoing projects, representative of the state-of-the-art in abatement theory and technology; a look at recent legislation; and the identification of program needs and emphasis. Combined sewer overflows are major sources of water pollution problems, but even discharges of stormwater alone can seriously affect water quality. Current approaches involved control of overflows, treatment and combinations of the two. Control may involve maximizing treatment with existing facilities, control of infiltration and extraneous inflows, surface sanitation and management, as well as flow regulation and storage. A number of treatment methods have been evaluated including high rate screening and microstraining, ultra high rate filtration, dissolved air flotation, physical/chemical treatment, and modified biological processes. A swirl flow regulator/solids separator of annular shape construction with no moving parts has been developed. High rate disinfection methods including new disinfectants have been applied. Promising approaches involve integrated use of controls and treatment. (EPA)
W75-09580

**STATE OF ARIZONA, ENVIRONMENTAL SERVICES NEEDS STUDY FOR GREENLEE COUNTY, 1970-1990.**
Arizona State Office of Economic Planning and Development, Phoenix. Planning Div.
June, 1974. 77 p, 32 tab, 10 fig, 11 plates, 40 ref.

Descriptors: *Arizona, *Water supply, *Sewage disposal, *Environmental sanitation, *Waste disposal, *Solid wastes, Environmental effects, History, Agriculture, Irrigation, Mining, Mine water, Livestock, Forecasting, Waste water treatment, Planning.
Identifiers: Greenlee County(Ariz).

Existing water systems and sewage and solid waste disposal facilities are identified and evaluated, and a projection is made of future needs for these facilities and services in rural areas of Greenlee County. Greenlee County will have only minor problems in maintaining environmental services over the next twenty years because little population growth is foreseen for the rest of the century. Problems that might occur can best be handled on the local level. The area's biota, geology and water supply are reviewed, brief historical sketches are given for the county's few communities. (Bowden-Arizona)
W75-09584

**THE QUALITATIVE AND QUANTITATIVE DETERMINATION OF SOLUBLE AND INSOLUBLE FORMS OF PHOSPHORUS IN SEWAGE TREATMENT PLANTS,**
Michigan State Univ., East Lansing. Inst. of Water Research.
F. M. D'Itri.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 514, $4.75 in paper copy, $2.25 in microfiche. Completion Report, June 1975. 93 p, 13 fig, 23 tab, 58 ref, append. OWRT A-042-MICH(1), 14-31-0001-3222.

Descriptors: *Waste water treatment, Ion exchange, *Sewage treatment, Michigan, *Phosphorus compounds, *Phosphates, Detergents, Sewage effluents, Activated sludge.
Identifiers: East Lansing(Mich), *Biochemical hydrolysis, *Orthophosphates, Pyrophosphates, Tripolyphosphates.

The major source of phosphorus to surface waters in the United States is condensed phosphates in detergents which hydrolize to orthophosphate, the form most readily available to plants and organisms. While the chemical hydrolysis of these compounds occurs at a relatively slow rate, the biochemical hydrolysis which takes place in wastewater is much more rapid. In the East Lansing Sewage Treatment Plant, the total ortho

and condensed phosphate concentration was highly variable. The average yearly tripolyphosphate and pyrophosphate concentrations in filtered primary effluent of 2.44 and 0.44 mg/l respectively decreased to 0.74 and 0.19 mg/l after secondary activated sludge treatment. In the primary effluent the orthophosphate, pyrophosphate and tripolyphosphate concentrations represented 43.5, 6.6, and 37.1 percent of the total phosphorus concentrations of the wastewater. After activated sludge treatment, the relative yearly concentrations of orthosphate, pyrophosphate and tripolyphosphate were 76.9, 3.8, and 14.9 percent of the total phosphorus content. During the same time concentration of organic phosphorus containing compounds also decreased from 0.84 to 0.21 mg/l.

**WATER TREATMENT PLANT,**
B. C. Bradford.
US Patent No 3,881,700, 4 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 934, No 1, p 182, May 6, 1975.

Descriptors: *Patents, *Waste water treatment, Water quality control, Water pollution control, *Mixing, Aeration, Turbulence, Treatment facilities, *Water purification.
Identifiers: *Turbulent mixing, *Chemical treatment.

A water treatment plant is described which provides for the mixing of chemicals with water and subsequent aeration of the water for aiding in purifying the water. The device includes a vertical tank which contains a hood. The solution of raw water and chemicals enter the top of the tank into the hood and collide with a cup-shaped deflector. The cup-shaped deflector reverses the flow of water with great turbulence and forces the water and chemical solution up into a mixing chamber defined by the upper portion of the hood. The solution then flows down under the bottom of the hood upwards in the tank. Intermediate the top and bottom of the tank is a loc layer which aids in removing impurities from the solution. The solution is then aerated by passing through a launder and a collection well. Subsequent filtration can take place if desired. (Sinha-OEIS)
W75-09645

**WATER TREATMENT APPARATUS,**
Norwich (England). (assignee)
F. Smith.
US Patent No 3,881,704, 5 p, 5 fig, 5 ref; Official Gazette of the US Patent Office, Vol 934, No 1, p 183, May 6, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Coagulation, Mixing, Water quality control, Separation techniques, Chemical reactions, Equipment.

An apparatus is described which is of particular value for forming a complex alkali metal-aluminium-silicate material that is completely soluble in hydrochloric acid and that is of particular value as a coagulant or coagulant aid in the removal of solids from an aqueous suspension. The apparatus is comprised of a mixing chamber, at least three separate inlets for liquids to the chamber, an outlet duct at a position distant from the inlets, a hydraulic ejector to which the outlet duct leads, and means for mixing under high shear within the chamber material introduced through the inlets. (Sinha-OEIS)

**METHOD AND APPARATUS FOR AERATION OF BIODEGRADABLE WASTE MATERIAL,**
Vand (Ren), Inc., Webster City, Iowa. (assignee)
N. R. Wittrup.
US Patent No 3,882,017, 5 p, 8 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 934, No 1, p 281, May 6, 1975.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Aeration, *Water pollution treatment, *Biodegradation, Oxygen, Equipment.
Identifiers: Pressure aeration, Turbulent mixing.

A method of pressure aeration of biodegradable waste material to enhance the rate of degradation by aerobic bacteria present in the waste material is disclosed. Under conditions of high velocity, a waste material slurry taken from a reservoir of biodegradable waste material is introduced into a confining zone to create a pressure greater than atmospheric, and to create high velocity turbulent flow. The aerated slurry is withdrawn from the confining zone and introduced into a mixing and separating zone. The mixing area and separating zone are separated by a back pressure means. Turbulent mixing occurs in the mixing area and the slurry is withdrawn from the separating area and discharged downstream from the back pressure creating means. Excess air and undissolved gases are separated. The aerated slurry is discharged under conditions of high velocity into a reservoir of waste material. (Sinha-OEIS)

**PROCESS FOR EFFLUENT WATER RECOVERY,**
Hill Brothers Chemical Co., Inc., City of Industry, Calif. (assignee)
Z. L. Burke.
US Patent No 3,882,019, 5 p, 1 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 934, No 1, p 282, May 6, 1975.

Descriptors: *Patents, *Water pollution control, *Water pollution treatment, *Water pollution prevention, *Chemical wastes, Industrial wastes, Filtration, Separation techniques, Chemical reactions, Lead, Sulfur compounds.
Identifiers: Process water.

The invention relates to a process for effluent water recovery by stripping lead and sulfuric acid from the effluent water to a level allowing the water to be recirculated as process water and converting the lead and sulfuric acid to a safe and reusable form. Lead carbonate is added to the effluent water in a first agitated enclosure thereby forming water, carbon dioxide, and insoluble lead sulfate. The water is filtered from the lead sulfate and conducted back to the manufacturing process for reuse. The filtered lead sulfate is added to a solution of ammonia, ammonium sulfate, carbon dioxide, and water in a second agitated enclosure to form ammonium sulfate and lead carbonate. The ammonium sulvate liquid is filtered from the lead carbonate and conducted to a holding tank for reuse in a second agitated enclosure. The filtered lead carbonate is dried to remove residual ammonia and then the dried lead carbonate powder may be conducted back to the first agitated enclosure for reuse. The carbon dioxide from the first agitated enclosure and the liberated ammonia from the dryer may be conducted back to the ammonium sulfate holding tank. Finally, excess ammonium sulfate from the holding tank may be conducted to a crystalizer for generation of ammonium sulfate crystals. (Sinha-OEIS)

US Patent No 3,882,025, 7 p, 8 fig, 1 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 934, No 1, p 284, May 6, 1975.

Descriptors: *Patents, *Waste water treatmen *Separation techniques, *Screens, *Water poll tion sources, Equipment, Storm water, Sol wastes.

A screening apparatus useful for screening of liquid-solids influent, such as storm water ove flow from sewer systems, comprises a cylindric screening device mounted for rotation with a hou ing, a slotted distributor for receiving a feed of i fluent and directing the influent toward the inn surface of the screen as a plurality of influe streams, and outlet means for receiving the e fluent which passes through the screen and th concentrate which does not pass through th screen. The screening structure and distributor ar mounted within a housing, and suitable collectio means are provided for receiving the effluent an the concentrate. The screening structure is in th form of a cylindrical cage and includes a numbe of screen panels, which may be removed fo repair, cleaning or replacement with differen mesh screens or different screen cloth. Th velocity of flow of influent onto the scree preferably is adjusted to be within a range belo which sufficient flow toward the screen does no occur and above which screen damage and splash back possibility may occur. The rate of flow an volume of influent into and from the distributor and the angle of the flows of influent from th slots on the distributor may be adjusted to provid a desired rotational speed for the screening struc ture and a desired centrifugal force. **MATERIAL FOR BIOLOGICAL DEGRADATION OF PETROLEUM,**
Dunn (John) Agencies Ltd., Vancouver (British Columbia). (assignee)
P. M. Townsley.
US Patent No 3,883,397, 2 p, 2 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 729, May 13, 1975.

Descriptors: *Waste water treatment, *Patents, *Oil spills, *Oil pollution, *Water pollution treatment, Water pollution control, *Microbial degradation, Nutrients, Nutrient requirements.

The invention contemplates the use of microbial nutrients for fostering microbial activity, the nutrients being in dry particulate form. The particles of nutrient are coated with a lipophilic, partially hydrophobic, and bidegradable coating. The particle size is such that particles will remain at the interface of the oil and water or be suspended in the oil so nutrient is slowly released and thus sustain microbial activity over an extended period. Each particle has a core of solid water soluble microbial available nutrient selected from the group consisting of nitrogen in the form of an ammonium compound, phosphorous in the form of a microbial available phosphate compound, and iron in the form of microbial available iron compound. The particle has a coating encapsulating the core composed of a metalic salt of a fatty acid which is lipophylic, partially hydrophobic and biodegradable, the metal in the salt being selected from the group consisting of magnesium, aluminum and calcium. **PROCESS FOR TREATING WASTE WATER,**
Etudes et Procedes d'Assainissement Purator (France). (assignee)
S. O. R. L. Lewandowski, and R. Lewandowski.
US Patent No 3,883,426, 7 p, 9 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 737, May 13, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, *Chemical reactions, *Flotation, Equipment, Mercury.
Identifiers: Aluminum amalgam.

Waste water is purified by means of the flotation process by using aluminum having on at least one surface thereof an amalgam of aluminum and mercury. The hydrogen gas and aluminum produced during the reaction between the waste water and the aluminum amalgam is used to float the impurities to the surface of the waste water being treated. The impurities are then removed and the purified water recovered. The flotation apparatus consists of a tank at one end of which the crude fluid is introduced about half way up. The fluid which has undergone flotation is removed through a siphon-type partition, the wall of which descends below the average height of the fluid and which is located at the other end of the tank. The aluminium plates, treated by means of traces of mercury or of a mercury salt are placed slightly above the bottom. A scraping device is placed above the surface of the fluid in the tank in order to remove the excess thickness of the layer of foam. Heavy sludges are removed at the bottom of the tank. (Sinha-OEIS)
W75-09656

**FLOATING SOLIDS RETURN DEVICE,**
Oldham (Robert R.), Inc., Sidney, Ohio. (assignee)
R. R. Oldham, and J. H. Wooddell.
US Patent No 3,883,427, 4 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 737, May 13, 1975.

Descriptors: *Patents, *Waste water treatment, Sewage treatment, *Settling basins, Water pollution control, Oxidation, Aeration.
Identifiers: Floating solids return.

A sewage treatment system is described in which liquid sewage, containing solids, is conducted into a first or primary settling tank. Liquid is drawn from an intermediate depth of the first tank and conducted to a reducing tank containing an aerator which is operated on a periodic basis and induces a current pattern into the fluid in the reducing tank. A final or outflow settling tank adjacent the reducing tank includes a wall in common with the reducing tank under which settled solids return to the reducing tank. A floating solids return is provided between the outflow and reducing tanks, and includes a provision for utilizing the current flow induced into the reducing tank by the aerator to conduct floating solids from the outflow settling tank to the reducing tank. The floating solids return is an opening in the reducing tank which faces in the same direction toward which the current, induced by the aerator, flows. The effluent is drawn from an intermediate depth of the outflow settling tank. (Sinha-OEIS)
W75-09657

**PORTABLE WATER SUPPLY SYSTEM,**
World Water Resources, Inc., New York. (assignee)
J. E. Hanford.
US Patent No 3,833,429, 6 p, 4 fig, 6 ref,; Official Gazette of the United States Patent Office, Vol 934, No 2, p 738, May 13, 1975.

Descriptors: *Patents, *Waste water treatment, Water quality control, *Water pollution treatment, Potable water, Water purification, Filtration, Demineralization, Water supply.
Identifiers: Chemical treatment, Portable water supply system.

An apparatus is provided whereby contaminated water is rendered potable. The apparatus comprises: a water source; first and second purification tanks each of which is provided with at least one vertical planar baffle, a prefiltering means; means for pumping water from the source to the filter tank, from the first tank to the second tank and from the second tank to an outlet means; a chemical addition means for chemically treating water in the second tank; and a first and second recycle means for recycling water in the first and second tanks, respectively. (Sinha-OEIS)
W75-09658

**SYSTEM FOR PURIFYING AND DISINFECTING WASTE WATER,**
K. H. Hildebrand.
US Patent No 3,883,432, 4 p, 1 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 739, May 13, 1975.

Descriptors: *Patents, *Waste water treatment, Water quality control, *Disinfection, *Water purification, Filtration, Mixing, Equipment, Hospitals. Ships, Water pollution control.

The invention relates to a system for cleaning and disinfecting waste water in hospitals and on ships. The system continuously processes the waste water with small disinfecting agent dosages and produces pure water. A mixing vessel is provided downstream from a container having a disintegrating device. The mixing vessel contains an inlet and an outlet for the waste water and at least one inlet for chemicals. Downstream from the mixing vessel is a closed vessel having an inlet and an outlet for the waste water, a sludge drain, and a filter device. The outlet line of the closed vessel contains a disinfecting apparatus. The inlet and the outlet of the mixing vessel are each connected to a dosage device for a chemical agent. The filter is installed in the vessel in such a way that when cleaning the filter the return sludge of the filter is passed into the sludge drain of the vessel by flowing water through the filter in a reverse direction. (Sinha-OEIS)
W75-09659

**REVERSE OSMOSIS APPARATUS,**
United Kingdom Atomic Energy Authority, London (England). (assignee)
For primary bibliographic entry see Field 3A.
W75-09661

**LIQUID TREATMENT APPARATUS,**
ITT Industries, Inc., New York. (assignee)
H. Lindquist.
US Patent No 3,884,812, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 934, No 3, p 1187, May 20, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Aeration, *Water quality control, Turbulent flow, Water circulation, Hydrodynamics, Sludge treatment, Liquid wastes.

An apparatus is described for waste water treatment in which upper and lower horizontally disposed planes, each having the general configuration of an airfoil, are mounted in a ring channel. An aerator is positioned adjacent to the bottom of the channel. The forward portion of the upper plane is disposed in front of the aerator while the entire lower plane is disposed in front of the aerator near the bottom of the channel. The planes cooperate hydrodynamically in such a way that the aerator itself serves to efficiently circulate the water through the channel, as well as aerate the waste sludge in the water. (Sinha-OEIS)
W75-09666

**APPLICATION OF FILTRATION THROUGH SEMI-PERMEABLE MEMBRANES FOR TREATMENT OF WASTES,**
J. Kepinski, and N. Chlubek.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-781 244, $3.25 in paper copy, $2.25 in microfiche. Translation from Przemysl Chemiczny, Vol 50, No 12, 1971, p 788-791.

Descriptors: *Reverse osmosis, *Membrane processes, *Waste water treatment, Water reuse, Water purification, Reclaimed water, Desalination, Desalination processes, Municipal wastes, Industrial wastes, Radioactive waste disposal, Acid mine water.
Identifiers: Hyperfiltration.

The basis of the hyperfiltration (reverse osmosis) process is discussed as well as the characteristics of membranes and hollow fibers and applications of reverse osmosis in the treatment of industrial and municipal wastes. Reverse osmosis was originally developed as a method of desalting salt and brackish waters. In practice, the pressures used in reverse osmosis are several times greater than the difference between the osmotic pressures of the substrate and the product, in order to compensate for the unfavorable phenomenon of concentration polarization and to increase the speed of the process. Heavy metal ions are relatively easily separated from others by reverse osmosis. It can also be used in the treatment of radioactive wastes where the concern is with reducing the volume before decontamination. An experimental apparatus used for treating the acidic waste water from the Kittanning mine in Pennsylvania was capable of producing over 5 cu m of desalinated water daily. Reverse osmosis is also being used in the treatment of tanning wastes, wastes from cellulose and paper factories, and wastes from other light industrial plants. Reverse osmosis is used for treating municipal waste water where the reuse of water is necessary because of a limited supply. The Los Angeles region reuses municipal wastes treated by reverse osmosis for agricultural and industrial purposes. Regeneration of water from wastes in space-vehicles is another specific application of reverse osmosis. (Orr-FIRL)
W75-09730

**ATTITUDES IN SLUDGE TREATMENT AND DISPOSAL,**
Delaware Univ., Newark. Dept. of Civil Engineering.
R. I. Dick.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 100, No EE5, p 1077-1087, October, 1974. 1 fig, 31 ref.

Descriptors: *Sludge treatment, *Sludge disposal, *Waste water treatment, *Reviews, Sewerage, Sewage, Management, Dewatering, *Attitudes.

A critical analysis of current practices of sludge management is presented. Sludge treatment and disposal involve thickening, conditioning, dewatering, conversion, transportation, and ultimate disposal. Materials incompatible with attempts to reclaim sludge materials or disposal of sludge should not be allowed in sewers. Sludge treatment and disposal must both be a part of the design of overall waste management facilities. The effects of both waste water treatment practices on sludge disposal and of sludge treatment practices on waste water treatment processes need to be evaluated more carefully than they have been in the past. Not all waste water treatment plants need sludge treatment and disposal facilities. Large-scale regional collection and disposal systems which would eliminate sludge handling at most plants are economically feasible and ecologically sound. Removal of water from sludges is neither necessary nor economically justified. Many present sludge management techniques do not include provision for ultimate disposal of the sludge but rather provide for the accumulation of sludges. Improvements are needed in the technology involved in present sludge treatment handling and disposal schemes as well as a reevaluation of some

of the basic approaches to the problem. (Orr-FIRL)
W75-09731

OPERATING RESULTS OF ELECTRODIALYSIS AND REVERSE OSMOSIS MUNICIPAL DESALTING PLANTS,
Reynolds, Smith and Hills, Jacksonville, Fla.
R. T. Skinde, and T. L. Tang.
National Water Supply Improvement Association Journal, Vol 1, No 1, p 15-21, July, 1974. 8 tab.

Descriptors: *Desalination, *Reverse osmosis, *Electrodialysis, *Potable water, Public health, Water supply, Membrane processes, Water purification, Facilities, Costs, *Waste water treatment.

Electrodialysis and reverse osmosis are the two primary membrane processes utilized in the desalination of salt and brackish water. Their use to provide potable drinking water from brackish waters is now accelerating rapidly. In January, 1972, there were 812 land-based desalting plants of 25,000 gpd capacity or larger throughout the world. Electrodialysis treatment with 30 percent salt passage of a well water with 2000 ppm TDS results in a product water of 600 ppm TDS, which is 100 ppm higher than the permissible level. However, reverse osmosis can treat well waters with much higher TDS contents. Treatment of a well water of 7000 TDS by reverse osmosis with 6 percent salt passage reduced the TDS content in the product water to 420 ppm TDS. The greatest application of electrodialysis is for low TDS waters which will not increase substantially over the years; reverse osmosis should be used where the TDS level is higher and a degradation of well water quality over the years is expected. The operating results of three electrodialysis and three reverse osmosis municipal treatment plants are summarized. A comparative analysis is presented of product water quality and operating costs in plants based upon these two membrane processes. (Orr-FIRL)
W75-09732

CARBON FROM LIGNITE OR COAL: WHICH IS BETTER,
ICI United States, Inc., Wilmington, Del.
P. B. DeJohn.
Chemical Engineering, Vol 82, No 9, p 113-116, April, 1975. 3 fig, 3 tab, 8 ref.

Descriptors: *Waste water treatment, *Activated carbon, *Adsorption, Municipal wastes, Industrial wastes, *Lignite, *Coals, *Carbon.

Granular carbons produced from medium-volatile bituminous-coal or lignite are the best activated carbons for use in waste water treatment. Factors to be considered when selecting a particular type include: ability to absorb enough impurities to meet allowable effluent standards; reasonable losses during carbon regeneration; minimal pressure drop and operating problems; and, lowest operating costs. More than fifty comparative granular carbon studies were performed on various municipal and industrial effluents including those from tertiary municipal treatment, oil refineries, dye plants, and pulp and paper mills. The two types of carbon produced from coal or lignite performed equally well on an equivalent volume basis when treating domestic waste streams. The most important factor that determines the absorption capacity of a carbon is available surface area. Bituminous-coal carbon has a greater total surface and more surface in the micropore range, while lignite carbon has more surface area in the transitional-pore range. Therefore, a lignite carbon performs better than a bituminous-coal carbon when treating a waste stream containing pollutants with mostly large molecules. Bituminous-coal carbon adsorbs small-molecule pollutants better than lignite carbon because it has more available surface area in the micropore range. However, thermal regeneration destroys the surface area in this range and after several regenerations both carbons perform about the same. Lignite carbons regenerate faster and under milder conditions than bituminous-coal carbons. (Orr-FIRL)
W75-09733

URBAN RUNOFF POLLUTION CONTROL--STATE-OF-THE-ART,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. Field, and J. A. Lager.
Journal of the Environmental Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No EE1, Paper 11129, p 107-125, February 1975. 4 fig, 2 tab, 22 ref, 2 append. EPA Contract 68-03-0179.

Descriptors: *Reviews, *Urban runoff, *Storm runoff, *Storm drains, *Surface runoff, *Cost analysis, Environmental sanitation, Waste water treatment, Flow control, Waste storage, Overflow, Combined sewers, Treatment, Hydrology, Sewage treatment, Water pollution, Drainage, Bacteria.
Identifiers: *Swirl regulator/concentrator, *Flow regulators.

Combined sewer overflows are major sources of water pollution problems, but even discharges of stormwater alone can seriously affect water quality. Current approaches involve control of overflows, treatment, and combinations of the two. Control may involve maximizing treatment with existing facilities, control of infiltration and extraneous inflows, surface sanitation and management, as well as flow regulation and storage. A number of treatment methods were evaluated including high rate screening and microstraining, ultra-high rate filtration, dissolved air flotation, physical/chemical treatment, and modified biological processes. A swirl flow regulator/solids separator of annular shape construction with no moving parts was highly developed. High rate disinfection methods including new disinfectants were applied. Promising approaches involve intergrated use of controls and treatment. (Lardner-ISWS)
W75-09762

CATALYTIC OXIDATION OF PHENOL IN AQUEOUS SOLUTION OVER COPPER OXIDE,
Delaware Univ., Newark. Dept. of Chemical Engineering.
A. J. Sadana, and J. R. Katzer.
Industrial and Engineering Chemistry Fundamentals, Vol 13, No 2, p 127-134, 1974. 9 fig, 2 tab, 51 ref, OWRT A-014-DEL(10).

Descriptors: *Oxidation, *Catalysts, *Chemical reactions, *Phenols, Kinetics, Industrial wastes, *Waste water treatment, Ultimate disposal, Chemical wastes, Aqueous solutions.
Identifiers: Aqueous-phase oxidation, *Catalytic oxidation, Free radical.

Catalytic oxidation of phenol in aqueous solution over supported copper oxide was studied in the batchwise mode at atmospheric and above-atmospheric pressure and between 369 and 419K. The reaction undergoes an induction period and transition to a much higher, steady-state activity regime. The reaction is first order with respect to phenol in both regimes, but the oxygen dependency decreases from first to one-half order in shifting from the induction period to the steady-state activity regime. The rate shows other than first-order behavior with respect to catalyst loading. The reaction is proposed to involve a free-radical mechanism. Oxidation rates at atmospheric pressure conditions are too slow to be of practical interest but can easily be brought into the range of practical importance by only moderate increases in temperature and operating pressure.
W75-09772

MODIFICATIONS TO THE EXECUTIVE COMPUTER PROGRAM FOR STEADY-STATE SIMULATION OF WASTEWATER TREATMENT FACILITIES,
Curran Associates, Inc., Northampton, Mass.
P. M. Meier, and G. R. Fisette.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-23-497. $4.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency. Report EPA-670/2-74-066, July 1974. 59 p, 7 fig, 15 ref.

Descriptors: *Computer programs, *Treatment facilities, *Waste water treatment, Water quality control, Sludge, Simulation models, Streams, Costs, Mathematical models, Combined treatment, Tertiary treatment.

An extended version is presented of the executive computer program for the steady-state simulation of waste water treatment facilities. This was originally developed at the National Environmental Research Center of the Environmental Protection Agency at Cincinnati, Ohio. The feasibility of joint treatment of sewage and ground refuse a modified waste water treatment facilities was evaluated. Major modifications of the computer program include an increase from 20 to 50 quality parameters, an increased capacity to accommodate 100 treatment processes and 200 streams rather than the original 25 processes and 25 streams, and an incorporation of the most recently developed cost functions, used for most of the unit processes. New mathematical models of advanced waste treatment processes were adapted for inclusion into the program. In addition, new subroutines were developed for a number of preliminary and sludge handling processes. (Prague-FIRL)
W75-09775

EXTENDED AERATION WASTEWATER TREATMENT,
J. T. Yang, R. Waller, and C. W. Mallory.
Canadian Patent 954,242. Issued September 3, 1974. Patent Office Record, Vol 102, No 36, p 84, September, 1974.

Descriptors: *Patents, *Aeration, *Waste water treatment, *Waste treatment, Sludge, Equipment, Clarification, Design, Construction.
Identifiers: *Extended aeration.

An improved extended aeration process is performed in a single tank. Wastes are aerated for periods ranging from 12 to 24 hours. During this time they are circulated in the tank in a controlled manner to avoid settling and compaction. The concentration of mixed liquor is maintained by the selective removal of clarified effluent. This eliminates the need for quiet zones for the settling of solids and for the return of compacted sludge to the aeration process. The apparatus is of modular construction and avoids the problems associated with sludge compaction. The preferred form is capable of being fabricated from planar elements either as a complete unit or as internals for installation in other types of tankage. (Orr-FIRL)
W75-09776

ACTIVATED CARBON USED TO CONTROL ODORS,
Calgon Corp., Pittsburgh, Pa.
W. D. Lovett, and R. L. Poltorak.
Water and Sewage Works, Vol 121, No 8, p 74-75, August, 1974. 1 fig.

Descriptors: *Activated carbon, *Odor, *Adsorption, *Sewage treatment, Pollution abatement, Tertiary treatment, *Waste water treatment.

Activated carbon adsorption systems are discussed as means for controlling odors from typical low concentration/large volume emissions, storage tanks, reactor vessels, and other small volume sources. Activated carbon's ability to adsorb organic and some inorganic materials in

preference to water vapor is due to its non-polar surface. Organic substances with molecular weights greater than 45 and boiling points higher than 0C are readily absorbed. Activated carbon can be reused after being regenerated. Regeneration can be accomplished by passing hot gas or steam through the carbon bed, by heating the carbon in a furnace, by a pressure swing such as the use of a vacuum, or by a combination of heat and vacuum, solvent washing or chemical treatment. The ability of activated carbon to increase the concentration of a combustible material can be utilized to decrease the fuel requirement for an incinerator. Many complaints about odors have been received by sewage treatment plants throughout the United States. One installation in California is controlling odors from trickling filters with hypochlorite scrubbing and subsequent adsorption. Odors from primary clarifiers can also be adsorbed by activated carbon. Carbon systems may be made more efficient by decreasing cycle times and/or adsorption temperatures. (Orr-FIRL)
W75-09777

**HOW TO GET LOW AMMONIA EFFLUENTS,**
F. F. Sampayo.
Water and Sewage Works, Vol 121, No 8, p 92-94, August, 1974. 3 tab.

Descriptors: *Waste water treatment, *Pilot plants, *Trickling filters, *Ammonia, *Nitrification, *Sewage treatment, Filtration, Biochemical oxygen demand, Suspended solids, Plastics, *Ohio, Treatment facilities.
Identifiers: Surfpac, Plastic media, Lima(Ohio).

The use of a plastic media trickling filter (Surfpac) for removing ammonia from effluents was studied at the Lima, Ohio, waste water treatment plant. The pilot plant was a steel shell 3 ft in diameter and 30 ft high packed with 21.5 ft of Surfpac media. Analysis of the summertime results showed that: plastic media trickling filters can produce effluents with less than 0.5 mg/liter ammonia nitrogen levels; recirculation of the filter effluent was beneficial in producing a more stable ammonia nitrogen concentration when the flow rate was high; the major effect of the tower was nitrification rather than stripping of the ammonia; and no net BOD removal or change in suspended solids concentration or pH value was effected by the tower. Analysis of the wintertime data showed that: ammonia oxidation was reduced in the winter; ammonia nitrogen levels less than 1.0 mg/liter were unobtainable; no BOD removal occurred through the tower; some of the suspended solids were removed by the tower; and the pH of the waste increased 0.1 units through the tower. Plastic media in nitrification towers are a viable means for removing ammonia nitrogen. However, to maintain very low ammonia nitrogen levels all year, breakpoint chlorination may be necessary for final polishing. The process is reliable and does not require skilled operators. (Orr-FIR)
W75-09778

**SOUND WAVES AND OZONE STERILIZE WASTEWATER.**
The American City, Vol 89, No 9, p 137, September, 1974. 2 fig.

Descriptors: *Waste water treatment, *Water pollution, *Chlorination, *Sound waves, *Ozone, Coagulation, Polymers, Sludge removal, Filtration, Bacteria, Virus, Public health.
Identifiers: *Sonozone treatment, *UHF sound waves, Rapid sand filters, Vertical pressure filters.

Effluent sterilization by UHF sound waves and ozone, is an effective method of disinfection and eliminates the hazards associated with chlorinated hydrocarbons released during chlorination. The estimated savings are about one cent per 1000 gallons. The treatment includes chemical coagulation, using iron salts and polymer additives to remove much of the phosphates and some nitrates; settling for sludge removal; rapid sand filtration; and sonics with ozone emitted from Welsbach generators. Bacteria are dispersed by the sonic waves. When the aggregate particles are broken up, a greater surface area is exposed to ozone oxidation, and the ozone demand is reduced. The sonics-ozone treatment is most helpful in plants now requiring prechlorination or intermediate chlorination during the treatment process. Waste water is retained only half the time of a conventional plant. The system destroys polio virus, cholera, salmonella, shigella, E. coli, staphylococcus and other microorganisms of public health concern associated with waste water. (Leibowitz-FIRL)
W75-09779

**ALTERNATIVE METHODS OF DISINFECTION: HOW EFFECTIVE,**
K. J. Roberts, and A. H. Vajdic.
Water and Sewage Works, Vol 121, No 9, p 72-75, September, 1974. 1 tab, 18 ref.

Descriptors: *Chlorination, *Disinfection, *Ozonation, *Gamma rays, *Waste water treatment, Environmental effects, Aquatic life, Bacteria.
Identifiers: Dechlorination, Residual chlorine.

Alternatives to chlorination for waste water or process water disinfection include dechlorination, chemical oxidation, and the use of ultraviolet and gamma ray ionizing radiation. Inactivation of coliforms, fecal coliforms, fecal streptococci, total bacterial count, bacteriophage, and salmonellae by gamma irridation and chlorine were compared. Effluent from an irradiation reactor was non-toxic to goldfish for periods up to six weeks. For certain treatment methods, further toxicity studies are suggested. Of the chemical methods, ozonation shows the most promise, especially with an added benefit of high residual dissolved oxygen in the effluent. With further research, deleterious effects of residual chlorine on aquatic life may be avoided by use of alternate treatment methods. (Prague-FIRL)
W75-09780

**INTEREST IN OXYGEN PROCESS GROWING,**
P. S. Ward.
Journal Water Pollution Control Federation, Vol 46, No 11, p 2449-2451, November, 1974.

Descriptors: *Waste water treatment, *Municipal wastes, *Industrial wastes, *Activated sludge, *Oxygenation, Aeration.
Identifiers: *High-purity oxygen activated sludge.

The high purity oxygen activated sludge process is becoming an established waste water treatment technique. Detroit, Tampa, and New Orleans are planning domestic waste water treatment plants utilizing this approach. Food processors, petrochemical manufacturers, and pulp and paper mills have employed the concept with apparent success. Four primary improvements over conventional air systems are claimed for oxygen activated sludge: increased stability; shorter detention times and consequently, more compact facilities; superior sludge characteristics; and, more efficient energy use. The key element of this system is the high degree of gaseous oxygen utilization. A high purity oxygen system is capable of a much higher level of oxygen dissolution than is a conventional air system, because the partial pressure of the oxygen in the aeration gas is the driving force for dissolution. The continuously renewed high concentration of oxygen supplied by the system preserves aerobic conditions while maintaining mixed liquor suspended solids concentrations ranging from about 4,500 to 8,000 mg/liter. The richly oxygenated, high MLSS concentration is responsible for the rapid rate of treatment obtained, cushions the process to shock loading, and makes it possible to treat a large volume of waste water in a relatively small facility. (Orr-FIRL)
W75-09781

**PHYSICAL CHARACTERISTICS OF MECHANICAL AERATORS,**
G. F. G. Clough.
Water Pollution Control, Vol 73, No 5, p 564-575, 1974. 9 fig, 3 ref.

Descriptors: *Aeration, *Activated sludge, *Sewage treatment, Equipment, Operational costs, Dissolved oxygen, *Waste water treatment.
Identifiers: *Aerators(Mechanical).

Mechanical aerators used for the activated sludge process of sewage treatment are discussed. Selection of an appropriate aerator is dependent upon a number of characteristics. New aerator designs thus far have shown no significant improvement over previous ones. Functions of a mechanical aerator include: dissolving oxygen in the water within the aeration tank; maintaining the activated sludge solids in suspension; mixing the water containing dissolved oxygen with the solids so that the bacteria have a continuous supply of dissolved oxygen; distributing waste throughout the tank; and removing some carbon dioxide from the solution. In addition, the aerator cools the aeration tank contents, produces spray or mist, may cause foaming, and produces some noise. Selection of a particular aerator should be based on the importance of its various functions, the net oxygen transfer efficiency, and the operational costs involved. (Prague-FIRL)
W75-09782

**SEWAGE UTILIZATION IN AGRICULTURE,**
Central Public Health Engineering Research Inst., Nagpur (India).
G. B. Shende.
Indian Farming, Vol 23, No 11, p 25-27, February 1974.

Descriptors: *Sewage, *Water quality, *Irrigation water, *Arid climates, *Sewage effluents, Nutrients, Organic matter, Fertilizers, Soil physical properties, Drainage, Public health, *Water reuse, Waste water treatment.
Identifiers: *Sewage farming, *India.

Reclamation and reuse of waste waters for agricultural use is a practical proposition in India. The problems and solutions should be investigated for maximizing the use of plant nutrients and organic matter without jeopardizing soil productivity and environment. The value of sewage for agricultural purposes lies in the presence of major and minor plant nutrients, irrigation water, and organic matter. Proper management in sewage farming is necessary to prevent public health problems such as food and water contamination, insects and odors. To achieve the maximum benefit from sewage utilization, scientific practice of irrigation is a must. Dilution of the sewage or flooding the soil with good quality water once or twice a year is desirable to leach down accumulated salts. Sewage farming should not be practiced if drainage is poor or where the water table is less than six feet below the soil surface. Additional research is needed and proper management guidelines need to be developed to increase sewage utilization for agriculture. (Mastic-Arizona)

water treatment, *New Jersey, *New York Atlantic Ocean, Sewage, Sewers, Sewage districts, Effluents, Waste water disposal, Marine biology, Sludge disposal, Sludge, Bays, Groundwater.
Identifiers: *Environmental Impact Statements, Middlesex and Monmouth Counties(NJ), Atlantic Highlands(NJ), *Raritan Bay(NY).

Funds have been requested from the EPA by the Sewerage Authorities of Middlesex and Monmouth Counties, New Jersey, for projects which involve additions and alterations to an existing sewage treatment plant and construction of sewers and a new sewage treatment plant. The waters of Raritan Bay, contiguous to the state of New York will be affected as will be the Atlantic Ocean, east of Atlantic Highlands, New Jersey. The environmental impact of the project consists of improving the quality of receiving waters by providing secondary treatment of wastewater prior to discharge, allowing cessation of waste water discharge into inland streams that have low assimilative capacities, and providing the concerned communities with centralized sewage treatments. The highly treated effluent will be introduced into the marine environment and there will be a waste sludge produced at the treatment plant. Adverse environmental effects include further lowering of groundwater levels, increased saltwater encroachment, and possible contamination of the marine environment at the sites of effluent and sludge disposal. Alternatives to the project are no action, various degrees of expansion in the service area, a regional sewerage system with bay outfall and a regional sewerage system with ocean outfall. Identifiers: *Madison(Wisc), Millfill, Sanitary landfills, Land application.

Highlights of seven years work at Madison, Wisconsin, are summarized. The concept of landfill disposal of milling refuse without daily cover was tested. Data were gathered on the operation and cost of milling equipment, the use of milled refuse in landfill, and the characteristics of milled refuse. Eventually, detailed investigations were made of both milled and unprocessed solid waste. While landfilled milled solid waste, or millfill, was highly approved by European landfill operators, further experiments in Wisconsin were seen as necessary. Study included determination of the effects of landfill on rats, flies, leachate, gas and trees, for quantification of various factors. (See also W75-09402) (Prague-FIRL)

Identifiers: Millfill, Sanitary landfill, *Madison(Wisc), Hammermill.

Individual research projects are described on the feasibility of using milling refuse for landfilling without daily cover. The demonstration projects were conducted between 1966 and 1972. Milling was begun in Europe to provide material suitable for composting. Originally single-rotor or double-rotor hammer mills handled homogeneous materials, necessitating manual sorting of larger, ungrindable items. Automation has been used in Europe since the 1950's. The Heil Company of Milwaukee, Wisconsin, installed a Gonard hamermill at the Madison Refuse Reduction Plant in 1967. Topics include: the Gondard operation; the Tollemache operation; two-mill, two-shift operations; and the costs of landfilling milled refuse. Vector studies were done of rats and flies at Madison and of rats at Purdue University. Observations were made on products of decomposition-leachate and gas as well as the effects on tree growth and other vegetation. Sixteen appendices detail the costs and quantities (dollars and tons) for milling and solid wastes at the Gonard and Tollemache operations. (See also W75-09401) (Prague-FIRL)

escriptors: *Fertilizers, *Sludge treatment, Activated sludge, Drying, Texas, Waste treatment.
entifiers: Houston(Tex), *Dried sludge.

e use of the activated sludge process and the bsequent drying and marketing of solids noved as fertilizer are discussed. In order to oduce a marketable fertilizer, the nitrogen con- t must be kept as high as possible. This involves ving activated sludge so as to minimize the isture, ash, grease, and cellulose. Costs of the yer include freight costs on the total weight of material, which in effect determine whether or the sale is profitable. Sludge treatment ocesses at Houston, Texas are described. For City of Houston, the revenue from selling fer- zer is about $21 per ton. (See also W75-09532) ague-FIRL)

**CENT SANITARY DISTRICT HISTORY IN ND RECLAMATION AND SLUDGE LIZATION,**
ropolitan Sanitary District of Greater Chicago,
. Halderson, B. T. Lynam, and R. R. Rimkus.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 129-133, 1974.

Descriptors: *Treatment facilities, *Sludge disposal, Nutrients, Irrigation, Agriculture, Experimentation, Land reclamation, Illinois, Waste treatment.
Identifiers: *Land application, Air dried sludge, Chicago(Ill).

Three major treatment plants handle the flow of sewage sludge in the area around Chicago in Cook County, Illinois. The sludge processed by an air dried method has the best nitrogen:phosphorus:potassium ratio for land utilization. The organic content of this air dried sludge is essentially humic matter. With the use of this sludge, land has been reclaimed in seven experimental projects. These occurred at the Northwestern University Campus land, at Ottawa, Illinois, Hanover Park, Calument Farm, at the Palzo Project in the Shawnee National Forest, at the Arcola Project, and at the Elwood Agronomy Research Center. One significant result of the research is an indication that application of freshly digested sludge can inhibit seed germination. If, however, the sludge is applied about one week prior to planting or if the sludge has been lagooned for a long enough time, germination is normal. In 1970, the Sanitary District of Chicago purchased land in Fulton County, Illinois, about 200 miles away from the sludge treatment facilities. Sludge is transported there by barge down the Illinois River, and the system of distribution, application, and subsequent cropping is described. Future plans for the Fulton County site and elsewhere include leveling the reclaiming unproductive land, as well as adding organic matter from sewage sludges to sites of strip mine spoils. Descriptors: *Sludge disposal, *Treatment facilities, Fly ash, Municipal wastes, Solid wastes, Planning, Legislation, Pennsylvania.
Identifiers: Allegheny County(Pa), Sludge management.

In the Allegheny County, Pennsylvania, area, solid waste management and sludge management are closely linked. Information is given about current practices. All new applicants for treatment facilities must provide data to the Pennsylvania Department of Environmental Resources as a regulatory agency. A feasibility study is being planned for a project of restoration of strip mine lands using municipal treatment plant residues and fly ash. Another research project planned is processing of dewatered undigested sludge produced at the Pine Creek water pollution control facility. (See also W75-09532) (Prague-FIRL)

**TRENCH INCORPORATION OF SEWAGE SLUDGE,**
Agricultural Research Service, Beltsville, Md. Biological Waste Management Lab.
J. M. Walker.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 139-149, 1974. 4 fig, 4 tab, 5 ref.

Descriptors: *Sludge disposal, *Waste water treatment, *Sewage sludge, Agriculture, Nitrogen, Drainage, Municipal wastes, District of Columbia, Treatment facilities.
Identifiers: Entrenchment, Blue Plains Plant(Washington DC), Trench incorporation.

The Blue Plains Plant, which serves much of the metropolitan Washington, D.C. area, has had serious sludge disposal problems. In order to discharge secondary effluents into the Potomac River, BOD had to be reduced. This reduction, by the use of ferric chloride or alum, increased the quantities of sludge produced, which necessitated additional sludge disposal. A research and demonstration study was undertaken to evaluate the trenching of raw and digested sewage sludge to improve marginally usable agricultural soils and to provide an environmentally and politically acceptable solution to sludge disposal. Field testing of the procedures in all weather, drainage control evaluation, monitoring of nitrogen, pathogens, and heavy metals in groundwater and surface waters, as well as supporting laboratory and greenhouse studies were conducted. The most likely difficulty was that nitrogen from the sludge might reach underground water. This problem could be minimized by underdraining the entrenchment site and retaining the drained water for irrigating the surrounding land. Entrenchment prevented contamination of surface water, buried pathogens, promoted slow nitrogen release, and favored denitrification. (See also W75-09532) (Prague-FIRL)

**OCEAN DISPOSAL EXPERIENCES IN PHILADELPHIA,**
Philadelphia Water Dept., Pa.
C. F. Guarino, and S. Townsend.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 151-155, 1974.

Descriptors: *Sewage disposal, *Legislation, Metals, Ocean disposal, Sewage sludge, Regulation, Mercury, Cadmium, Pennsylvania, Waste treatment.
Identifiers: Philadelphia(Pa), Marine Protection Act.

From 1961 to May, 1973, the city of Philadelphia had been disposing of its sewage by barge to an area 13 miles off Cape Henlopen, Delaware. In 1972, the United States passed the Marine Protection, Research and Sanctuaries Act, which effected a permit system whereby the dumper would have to meet specific requirements. The permit received by Philadelphia required that a new site be chosen 50 miles off the coast, that an expanded cost analysis be conducted, and that monitoring be continuous at the new location. Another provision of the Act requires that the City determine the sources, relative contributions, and controllability of heavy metals within the City's drainage area. At present, Philadelphia sludge exceeds the criteria for mercury and cadmium as defined by the Act. However, there is a conflict as to whether the laboratory analysis is accurate (its range is large) and whether or not the criteria are too stringent. Another problem is the interaction of wastes within a disposal area. Because Philadelphia was required to dump 50 miles offshore, a nearby disposal for acid wastes may be interacting with the sludge to cause flocculation. Alternatives to ocean disposal are three to four times more costly to the City, and land disposal requires a continually increasing amount of land space. Implementation of the Marine Pollution Act pointed out that regulations should not overcontrol or create new problems. However, the regulation has prompted research into new areas of knowledge of sludge disposal. (See also W75-09532) (Prague-FIRL)
W75-09550

**SLUDGE DISPOSAL BY INCINERATION AT ALCOSAN,**
Allegheny County Sanitary Authority, Pittsburgh, Pa.
G. A. Brinsko.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 157-161, 1974. 5 fig, 3 ref.

Descriptors: *Sludge treatment, *Incineration, *Sludge disposal, Odors, Costs, Waste disposal, Public rights, Combustion, Solid wastes, Pennsylvania, Waste treatment.
Identifiers: Pittsburgh(Penna).

The Allegheny County Sanitary Authority, or Alcosan, has controlled the problems of sludge treatment and disposal for the Pittsburgh area since the middle 1940's. It was decided in 1945 that incineration would be used for final sludge disposal rather than to discharge wastes into the rivers. Facilities from 1959 to 1973 provided intermediate treatment only slightly better than primary. Final disposal was accomplished in C. E. Raymond Flash-Drying incinerators. In 1973, modernization occurred, the present incinerators are evaporators of water. This method of disposal has caused many problems, and is extremely costly. Thirty-seven percent of Alcosan's operating budget is related to the incinerator operation and fifty percent of the overall range maintenance budget goes toward upkeep of incinerators. Odors from the incinerators have caused severe public reaction. Hydrogen peroxide has so far been the most effective chemical for combatting this problem. Incineration of primary and waste activated solids together has created the problem of an increased heat value of the sludge. chamber temperatures range from 1650 F to 1900 F and cause slagging. The accumulated slag must be removed, resulting in a loss of furnace time. A new duct system may alleviate this situation. In spite of the problems associated with incineration, the method was chosen because of the lack of available land and the fact that the Pittsburgh sludge is too low in nitrogen to reclaim the material as fertilizer. An alternate solution might be to incinerate both sewage and solid waste materials together for the generation of steam as a profitable by-product. (See also W75-09532) (Prague-FIRL)

**AGRICULTURAL UTILIZATION OF DIGESTED SLUDGES FROM THE CITY OF PENSACOLA,**
Baseline, Inc., Pensacola, Fla.
J. A. Edmisten.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 177-182, 1974. 9 fig, 5 tab, 4 ref.

Descriptors: *Sludge disposal, *Agriculture, Sewage treatment, Soils, *Florida, Land use, Lagoons, Bacteria, *Sludge treatment, Waste water treatment.
Identifiers: *Liquid digested sludge, Land application, Pensacola(Fla)

Previous to 1974, the digested liquid sewage sludge from the Pensacola Main Street Sewage Treatment Plant was disposed of by dumping the material at a sanitary landfill 18 miles away. In 1973, the County Commission of Escambia County Florida and the City Council of Pensacola conducted an experiment, using liquid digested sludge for agricultural production on deep sandy coastal plains soils. Greenhouse experiments established the rates of sludge application tolerable to tomatoes, corn, and a variety of horticultural materials. Test fields and plots have been designed to control application. When soils are too wet for direct application, tankers carrying sludge dump it into a holding lagoon. Precautions against bacterial hazards are being tested by feeding dried sludge to test animals, which will be slaughtered after six months and their tissues examined. Crops are being grown on small test plots with varying rates of sludge applications; crop responses so far seem to be similar to those of earlier greenhouse studies. With organic matter accumulation, it is likely that cyst nematodes, a pest to soybeans, will be destroyed, thus yielding better crops. (See also W75-09532) (Prague-FIRL)

**INSTITUTIONAL PROBLEMS ASSOCIATED WITH SLUDGE DISPOSAL,**
Washington Suburban Sanitary Commission, Hyattsville, Md.
K. J. Brough.
In: Municipal Sludge Management, Proceedings of the National Conference on Municipal Sludge Management, June 11-13, 1974, Pittsburgh, Pennsylvania, p 183-186, 1974. 4 ref.

Descriptors: *Public rights, *Public health, Information, Regulations, Municipal wastes, Waste water treatment, *Sludge disposal, Treatment facilities, Incineration, Environmental effects, Planning, Maryland, Waste disposal.
Identifiers: Piscataway(Maryland).

Public attitudes on sludge disposal cause institutional problems which effect regulations for municipal sludge treatment and disposal. In one example, at the Piscataway (Maryland) Wastewater Treatment Plant, incineration was used for sludge disposal. Citizens alleged that incinerator test operations caused high blood lead levels in area children; EPA and the County Health Officer could find no evidence of a health hazard. However, a resolution was passed that stopped incineration until some undetermined time when it is proven conclusively that no health hazards exists. The Washington Suburban Sanitary Commission, which controls the Piscataway facility, has millions of dollars invested in the incinerators. In addition, tests for the potential health hazard, ironically, cannot be performed without operating the incinerators and quantitatively measuring their output. It was recommended that the public be involved in planning decisions. The impact of institutional problems will be minimized if the public forms its values and attitudes before disposal methods are in operation. (See also W75-09532) (Prague-FIRL)

ntifiers: Impoundment water, Norman(Okla).

e objectives were to determine time, season, antecedent conditions when impoundment and und water separately reach optimum quality. ther, the project was to compare the quality of e two water supply sources at any given time s to establish quantified combinations which ld give optimum quality. Water quality for the ls was essentially constant, therefore wellr quality parameters, for purposes of this y, were also considered to be constant. The hod used to evaluate the data was stepwise ession utilizing the IBM statistical subroutine kage. Regression analysis was performed on data which were divided into the four seasons. resulting linear equations are multiterm and blished correlation between the independent ables, rainfall, lake-level, surface water used, -water used, and the water quality dependent ables deemed important. The dependent variare pH, alkalinity, hardness, turbidity, and concentration. Only the regression equations est fit are presented.

DISINFECTION OF SOIL STRIPS THROUGH THE DRIP IRRIGATION SYSTEM,
Hebrew Univ., Rehovth (Israel).
M. Uzrad, and S. D. Goldberg.
In: Proceedings of the Second International Drip Irrigation Congress, p 137-141, (1974). 3 tab.

Descriptors: *Disinfection, Management, Crop production, Irrigation systems, Irrigation practices, Irrigation, Agriculture, Water pollution control, Path of pollutants.
Identifiers: *Trickle irrigation, *Drip irrigation, *Israel, *Methyl bromide.

Seasonal crops (vegetables) are often grown on a limited area in the Arava agricultural plots. It is also customary to apply manure of unknown origin. After several seasons of cultivation, there is a marked decrease in the level of the agricultural production and the fields become infested with weeds. Usually soils are disinfected with methyl bromide. Row crops in the Arava desert are irrigated by the drip system, thus the cultivation, fertilization, and irrigation are restricted to the cultivated strip. An experiment was conducted to study the possibility of also applying the disinfectant only to the cultivated strip through the drip system. Hot gaseous methyl bromide was applied through the drip laterals and through the drippers which were covered by plastic mulch. Crop yields for the treated areas were three times greater than in the control plot. (See also W75-09423) (Skogerboe-Colorado State)

In: Proceedings of the Second International Drip Irrigation Congress, p 376-381, (1974). 2 fig, 3 tab, 4 ref.

Descriptors: *Return flow, *Water quality, *Salinity, Surface irrigation, *Saline water, Saline soils, New Mexico, Texas, Irrigation practices, Irrigation systems, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

Deterioration of water quality in the Rio Grande is a major problem for water users in New Mexico and Texas. From near Santa Fe, New Mexico to El Paso, Texas, a distance of 270 miles, the total of dissolved solids increases from 221 ppm to 787 ppm while the percent of sodium increases from .25 near Santa Fe to 52 at El Paso. The deterioration in quality is due to the return of lower quality drainage water from the irrigated areas to the river. This paper describes a project designed to determine, under field conditions, rates of water and salt movement in the soil and subsequently to the drains as affected by frequency and amount of trickle irrigation, as compared to frequency and amount of surface water application. Both return flow quality and quantity are evaluated. (See also W75-09423) (Skogerboe-Colorado State)

OIL SKIMMER WITH OSCILLATABLE CIRCULAR LOOP,
E. L. Brill, and B. M. Brill.
Canadian Patent 963,398. Issued February 25, 1975. Patent Office Record, Vol 103, No 8, p 42, February 1975.

Descriptors: *Oil spills, *Patents, Equipment, Water pollution control, Oil wastes, *Skimming, Separation techniques, Pollution abatement.
Identifiers: *Oil skimmers, Loops.

A device to skim oil which is floating on top of a pool of water is described. The skimmer consists of an endless substantially rigid loop of a uniform cross-section. This loop is gripped at its upper edge by a pair of rolls which rotate in opposite directions and engage the loop at one zone in diagonally opposed quadrants. The rolls rotate the loop in its own plane and cause it to pass continuously in and out of the pool of water or hydrophilic liquid and thus to attract hydrophobic material

such as oil. The oil or any colloidal material is then lifted by a coil and squeezed out as it passes through the rolls. The loop may oscillate about an axis substantially tangential to the loop at the driving zone. (Prague-FIRL)

Descriptors: *Pollution abatement, Standards, *Air pollution, Northeast US, Alternative planning, Fuels, *Pollution taxes(Charges).
Identifiers: *Financial incentives, *Fuel oil, *Pollution control variances.

Confronted with shortages of low-sulfur content residual fuel oil, several air-pollution-control authorities in the northeastern states were forced to relax air-quality standards during the winters of 1972-73 and 1973-74. The authorities did so by granting variances to their sulfur-content standards for residual fuel oil. The characteristics of these variances are examined. Alternative policies such as direct regulation, fuel-oil surcharges, emission taxes and quantity control are discussed. (EPA)

**RESEARCH NEEDS FOR WATER RESOURCES CONTROL IN CALIFORNIA.**
California State Water Resources Control Board, Sacramento. Div. of Planning and Research.
Publication No 48, April 1973. 48 p.

Descriptors: *Research priorities, *Water resources, *California, *Water quality control, Methodology, Water rights, Waste disposal, Wells, Disinfection, Recycling, Waste water disposal, Erosion, Silting, Surface waters, Groundwater, Salinity, Eutrophication, Toxicity, Oil, Mine wastes, Water reuse, Legal aspects, Economics, Institutions, Data processing, Water pollution control

The research program of the California State Water Resources Control Board assigns highest priority to the development of methodology and data for the State Board and the nine regional water quality control boards in their planning and control functions. Currently acute problems and research for permanent solutions to problems are emphasized. Three classes of research priority are established as guidelines for developing research studies. The Priority I topics include methodology and data for analysis of water rights applications, impact of wastes on groundwater, and influence of toxicants and biostimulants on surface waters. Reliable disinfection systems, recycling and use of wastewater solids and reclaimed wastewater, and the control of pollution from irrigated agriculture are also in the priority I group. Additional guidelines are identified relating to funding of research by the Board, literature search requirements, project duration, and proposal evaluation. The following water resources control problems were discussed: erosion and siltation, degradation of groundwaters, increasing salinity of surface waters, eutrophication, toxicity, oil and other hazardous material spills, mine wastes, and geochemical hazards. Water quality monitoring and data are important in control programs. Problems in wastewater treatment, residue processing and disposal, and wastewater reclamation and reuse were described. Legal, economic, and intitutional problems were identified and may be the most difficult to resolve. A detailed description of overall research and development needs in major water resources control subjects was included. (Dawes-ISWS)

**HYPOLIMNETIC OXYGENATION USING LIQUID OXYGEN,**
Union Carbide Corp., San Francisco, Calif. Aquatic Environmental Sciences.
A. W. Fast, W. J. Overholtz, and R. A. Tubb.
Water Resources Research, Vol 11, No 2, p 294-299, April 1975. 7 fig, 8 ref.

Descriptors: *Ohio, *Oxygenation, *Hypolimnion, *Waste water treatment, *Dissolved oxygen, *Oxygen, Eutrophication, Dissolved oxygen analyzers, Treatment, Zone of aeration, Stratification, Lakes, Thermocline, Water properties, Productivity, Fish, Nutrients, Aquatic life, Aeration, Thermal stratification, Fisheries.
Identifiers: *Side stream pumping, Ottoville Quarry(Ohio).

A new system of hypolimnetic oxygenation called side stream pumping (SSP) was described. The SSP system uses liquid oxygen and a conventional water pump, whereas most other hypolimnetic oxygenation systems use compressed air and a special aeration chamber. The SSP system was tested in Ottoville Quarry, Ottoville, Ohio, during the summer of 1973. Hypolimnetic oxygen concentrations increased from less than 0.5 mg/l to over 8.0 mg/l during 2 months of operation, and thermal stratification was maintained. These improvements created a suitable habitat for cold-water fish, but care must be exercised in the use of the SSP system to avoid potential problems with high, free carbon dioxide concentrations. (Henley-ISWS)

Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 513, $3.75 in paper copy, $2.25 in microfiche. Research Report No 62, Montana University Joint Water Resources Research Center, Bozeman, March 1975. 29 p, 1 fig, 16 ref. OWRT A-058-MONT(1).

Descriptors: Ecology, Ecosystems, Zoology, *Dominant organisms, Biological communities, Fish, Insects, *Stoneflies, Systematics, *Bioindicators, Water quality.
Identifiers: Biological models, Dominance index, *Diversity index, *Simpson's index, Nymphs.

Two papers are presented. The first is entitled, Dominance and Diversity Measures: Separation of Components, by A. L. Sheldon. Simpson's index of dominance is separable into additive independent components related to species richness and equitability. A test of the method suggests richness to be the only meaningful component. If this is generally true, then the expected number of species in a sample of a given size is recommended as a diversity index. This index includes both richness and evenness aspects of diversity. The second report, The Nymphs of the Genus Zapada (Insecta: Plecoptera) of Western North America, by R. A. Haick, lists the major species of this genus. (Holje-Montana State)

**A CASE STUDY OF ESTUARINE POLLUTION AND LOCAL AGENCY INTERACTIONS,**
University of Southern Mississippi, Hattiesburg. Bureau of Business Research.
C. P. Cartee, N. O. Murray, and D. C. Williams, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 516, $3.75 in paper copy, $2.25 in microfiche. Mississippi Water Resources Reseach Institute, Mississippi State, Completion Report, June 1975. 43 p, 3 fig, 23 ref. OWRT A-089-MISS(1).

Descriptors: *Governmental interrelations, Water pollution, Estuaries, *Mississippi, Gulf of Mexico, *Local governments, Water quality standards, *Jurisdiction, Legal aspects, *Administrative agencies.

A case study analysis was made of a specific pollution problem on the Gulf Coast of Mississippi with emphasis on the agency and governmental interface. Numerous personal interviews with representatives of affected political subdivisions and involved agencies were utilized in addition to secondary sources. Much negative reaction was discovered. Indepth interviewing revealed many points of conflict between the enforcement agencies and the affected local units of government. Much misunderstanding centered around procedures used in collecting and testing water samples and the evolution and interpretation of the water quality criteria. Several intricate legal questions were found to characterize the problem with respect to the 26-mile, man-made sand beach, especially with respect to jurisdictional responsibilities in providing public notice of the water's quality. Overall, the study emphasized (1) the importance of input mechanisms and education of local governmental officials relative to the development, evolution and use of pollution standards, and (2) the need for identifying and establishing jurisdictional authority for bodies of water in terms of public pollution notifications when large expanses of beach front are involved.

**UNDERWATER DRILLING POLLUTION CONTROL CURTAIN,**
Sun Oil Co., Dallas, Tex. (assignee)
C. M. Mason.
US Patent No 3,879,951, 3 p, 6 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 933, No 5, p 1965, April 29, 1975.

Descriptors: *Patents, *Oil pollution, *Water pollution control, *Oil spills, Offshore platforms, Equipment, Well screens, Pollution abatement.
Identifiers: *Pollution control curtains.

A pollution control curtain attached to the sea floor on one end and to a collar floating on the surface of the sea on the other end for positioning around a drilling platform entraps petroleum fluids seeping from the well head or sea floor being serviced by the platform. Fluids are conveyed to the surface within a predefined area from which they can be collected. The body of the curtain can be fabricated from any flexible or rigid material with sufficient strength and resistance to corrosion to serve in a subsurface structure, such as steel plate and cable, plastic, heaving gauge, Neoprene, canvas or combinations of any of these materials. **WATER QUALITY ANALYSIS SYSTEM WITH MULTICIRCUIT SINGLE SHELL HEAT EXCHANGER,**
E. A. Houser, and B. W. Schwindt.
US Patent No 3,880,226, 7 p, 14 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 933, No 5, p 2055, April 29, 1975.

Descriptors: *Patents, *Water quality control, *Electric powerplants, *Heat exchangers, Water analysis, Sampling, Temperature, Cooling water, Power system operation, Equipment.

A modular water quality analysis system for steam electric power generating plants is disclosed which includes a single shell multicircuit heat exchanger having means to individually vary the rate of flow of cooling water through each of the multiple circuits so that the single heat exchanger can simultaneously cool a number of samples entering it at widely differing high inlet temperatures to the same lower range of outlet temperatures. The heat exchanger has a physical construction such that it can be mounted on top of the system rack which contains modules of apparatus for accepting water or steam samples from various test points in the power generating system, reducing the pressure and temperature, directing and metering the flow of samples, and performing analyses for such water characteristic as pH, specific or cation conductivity, dissolved oxygen, sodium content etc. The fact that the single shell heat exchanger can be mounted on top of the system rack makes possible a considerable saving in cost, space and weight, a greater flexibility in system layout design, together with greatly improved access to the system components for adjustment and maintenance purposes, and faster instrument reponse due to shorter sample tubing runs. **COLLECTION AND RECOVERY SYSTEM FOR OIL SPILLS,**
Ocean Systems, Inc., Reston, Va. (assignee)
F. A. March, and L. S. Brown.
US Patent No 3,883,433, 4 p, 5 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 934, No 2, p 739, May 13, 1975.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution control, *Separation techniques, Equipment, Weirs.

The apparatus described performs a substantial separation of the oil from the water before the oil is discharged for delivery to a pick-up station or accompanying vessel and is highly conformable to wave motion so that oil escape is minimized. The discharged oil is in an essentially reclaimed state. The invention features a plurality of rigid weir-plates disposed along a primary weir and supported by discrete weir-plate floats, each weir-plate having a weir opening. The weir-plates are spaced from each other along the primary weir and connected to one another by a flexible sheet, thereby making the primary weir conformable to wave motion. Stiffeners connected between the primary weir and the secondary floats maintain the spacing. A number of secondary weirs are supported on secondary floats, each having a lip positioned beneath its associated secondary float, therby admitting fluid from the upper layer of fluid within the basin to an oil discharge without air entrainment. As the apparatus moves over the body of water there is a thickening of the oil ahead of the weir plate and a reduced pressure beneath the basin. The primary weir may be towed with the preponderance of towing forces carried by a tension line. Bridles proportioned in length deploy the primary weir along a parabolic line. (Sinha-OEIS)
W75-09660

**PROCESS FOR SEPARATING LOW API GRAVITY OIL FROM WATER,**
Union Oil Co. of California, Brea. (assignee)
V. L. Traylor.
US Patent No 3,884,803, 5 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 934, No 3, p 1184, May 20, 1975.

Descriptors: *Patents, *Oil pollution, *Oily water, *Pollution abatement, *Water pollution control, *Separation techniques, Water pollution control.
Identifiers: Gas flotation, Low gravity oil.

In cases where gravity separation is not sufficient to obtain the water quality desired, gas flotation processes are employed for oil-water separation. However they are not as effective separating low gravity oils, such as oils having API gravities of about 20 deg or lower. Accordingly it is a primary object of this invention to provide a process for separating low API gravity oil from water. A small amount of a high API gravity oil is added to the oil-contaminated water and the misture thereafter is contacted with finely divided gas bubbles to float the oil and included particulate solid matter to the surface for mechanical separation. A low oil-content product water suitable for discharge into public waters or sewer systems, or for use in industrial and agricultural applications is produced. (Sinha-OEIS)
W75-09664

**ANTI POLLUTION WATERWAY DEVICE AND PROCESS,**
W. Smyrnow.
US Patent No 3,884,810, 5 p, 9 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 934, No 3, p 1186, May 20, 1975.

Descriptors: *Patents, *Water pollution control, Water quality control, *Pollution abatement, Pollution(Stream), Turbulent flow, Air circulation, Equipment, Bubbles.

The process includes the cleansing of waterway flowing water by directing a gaseous fluid such as compressed air through a submerged conduit extending along a line of flow at an oblique angle to the direction of the flowing water, releasing the compressed air in the form of bubbles all along the extension of the conduit at a plurality of closely arranged points such that an oblique barrier of bubbles is formed obliquely across the direction of flow of water, there being a sufficient amount of bubbles released to form a major up-draft current of water toward the surface. Currents counter to the normal flow of water are created at least sufficiently to temporarily deter the movement of debris and other pollutants but with the downstream flow of the current causing the pollutants to slide obliquely along the oblique barrier in a downstream direction to a collection point which includes a collection means of any desired or conventional type. The system consists of a rigid, elongated member having a weight substantially greater than the water; a conduit; mounting means to fix the elongated member to the bottom surface at an angle from about 15 to 75 deg to the direction of flow; a plurality of air escapement perforations; and pump means providing air at a pressure sufficient to cause a rising plane of turbulence from the conduit to the surface of the waterway. (Sinha-OEIS)
W75-09665

**OIL INTERCEPTORS FOR SEPARATING OIL FROM WATER BY GRAVITY,**
Shell Oil Co., Houston, Tex. (assignee)
J. Cornelissen.
US Patent No 3,884,815, 4 p, 10 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 934, No 3, p 1188, May 20, 1975.

Descriptors: *Patents, *Oily water, *Oil pollution, *Water pollution control, *Separation techniques, Gravity, Ships, Equipment.
Identifiers: Separator vessel.

The invention is concerned with an oil interceptor of the type which employs one or more packs of closely-spaced inclined plates between which an oil-water mixture is passed. As the mixture flows downward between the plates under laminar flow conditions, the lighter-than-water oil globules rise and collect under the under surface of each plate and the heavier sludge and sediment settle out on the upper surface of each plate. The oil globules coalesce and rise free of the plate pack and the sludge settles to the bottom of the interceptor vessel containing the plate pack. The object of this invention is to adapt this type of interceptor for use on board ship for cleaning ballast and tank-cleaning water of tankers. The oil interceptor or separator vessel has an outlet oil line with an outlet oil weir and an outlet water line with an outlet water weir. The weirs are mounted adjacent one another and at a position above the main part of the separator vessel, the edge of the oil weir being at a higher level than the edge of the water weir. When the separator vessel is mounted on board a ship, at least the weirs are oriented whereby the edges of the weirs lie in substantially a port-starboard direction. (Sinha-OEIS)

**MAKEUP REQUIREMENTS FOR COOLING PONDS,**
Hanford Engineering Development Lab., Richland, Wash.
J. C. Sonnichsen, Jr.
Journal of the Environmental Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No EE1, Paper 11114, p 15-25, February 1975. 3 tab, 10 ref, 3 append.

Descriptors: *Cooling water, *Water utilization, *Ponds, *Environmental engineering, Water requirements, Reservoirs, Artificial lakes, Thermal powerplants, Consumptive use, *Thermal pollution, Heated water, Evaporation, Water temperature.

The United State's demand for electricity has doubled every 10 years for the last few decades. At present, the rate of growth is even greater. Expert opinion suggests that this trend will continue for the next 20 years. Assuming this is true, the number of kilowatt-hours produced annually will quadruple over this same time span. In the future, power plants will rely more heavily on closed evaporative cooling systems. Water makeup requirements for operating power plant cooling ponds was further reviewed. Water loss was first defined and then computed in terms of the type and size of pond. A distinction between using a natural or man-made pond was drawn. For natural ponds, this flux was considered part of the total natural flux. Results suggested that water loss is dependent on the type as well as the size of pond employed. Computed water makeup requirements for man-made and natural cooling ponds with mixed flow or slug flow were tabulated for three different hydrologic regions of the United States: (1) arid, (2) where precipitation approximately balances natural evaporation, and (3) where precipitation exceeds natural evaporation. Mathematical models used for completely mixed ponds, slug flow ponds, and evaporation were given in an appendix. (Humphreys-ISWS)

**RESERVOIR OPTIMIZATION FOR WATER QUALITY CONTROL,**
Pennsylvania Univ., Philadelphia.
E. Kaplan.
Available from University Microfilm, Inc., Ann Arbor, Michigan, 48106, Order No 74-22859. PhD Thesis, 1974, 585 p.

Descriptors: *Algorithms, *Water quality control, *Reservoirs, Lakes, Water quality standards, Biochemical oxygen demand, Phosphates, Nitrates, Discharge(Water), Flood control, *Optimization, Hydrogen ion concentration, Dissolved oxygen, Dissolved solid.
Identifiers: Fecal coliforms.

A constrained nonlinear optimization algorithm (COMET) and a program to simulate lake ecology (LAKECO) are used to control both the quantity and the quality of water within and discharged from a reservoir. A multiparameter water quality index was used as an objective function for optimization. Quality parameters included temperature, dissolved oxygen, 5-day BOD, pH, total dissolved solids, phosphates, nitrates, and fecal coliforms. Reservoir elevation and discharge quantity also were considered. An application was given for a proposed reservoir where it was found that stringent design and legal requirements could be met for epilimnetic and discharged water during the period of simulation. The technique can also be used to provide both water quality and flood control capabilities to existing reservoirs capable of selective withdrawal. (Prague-FIRL)

**GYPSUM CAN IMPROVE YOUR WATER ALSO,**
Central Soil Salinity Research Inst., Karnal (India).
R. C. Sharma, and I. P. Abrol.
Indian Farming, Vol 23, No 6, p 21-22, September 1973. 1 tab.

Descriptors: *Gypsum, *Irrigation, *Water quality control, *Groundwater, *Arid lands, *Irrigation water, Sodium, Carbonates, Bicarbonates, Calcium, Application methods.
Identifiers: India.

In arid and semiarid areas where surface water supplies are inadequate, it has been necessary to explore for sub-soil water for agricultural use. Complaints are often received from farmers about the low quality water obtained from tubewells. For successful agriculture, it is necessary to have good quality water for irrigation, or take measures to improve the water quality if it is poor. The main problem is generally one of excess sodium and carbonate or bicarbonate. Their effects can be rectified by adding soluble calcium to the water or soil which is being irrigated. The amount of gypsum needed will depend on the water quality which can be tested at the nearest soil testing laboratory. If the electrical conductivity of water is less than 4000 micromhos/cm and the water contains residual sodium carbonate, gypsum is needed. Gypsum can be applied either to the water or to the soil directly; the application will have to be repeated every year or alternate years depending upon the improvement obtained. (Mastic-Arizona)

Descriptors: *Oil, *Oil pollution, *Oil spills, *Gulf of Mexico, Alabama, Mississippi, Continental shelf, Florida, Oil industry, Oil wastes, Environmental effects, Shoreline cover, Shore protection, Shores, Gulfs, Marine biology, Estuaries, Wetlands, Fishing, Navigation, Ships, Military aspects, Recreation, Aesthetics, Pipelines.
Identifiers: *Environmental Impact Statements, Energy crisis, Oil Pollution Act.

This second volume of the outer continental shelf oil and gas general lease sale, offshore Mississippi, Alabama and Florida environmental impact statement is addressed to the probable environmental impacts of the project and potential mitigating measures. The following environmental impacts were considered: impacts on the living components of the environment (open gulf, marine life, shoreline, estuaries, and wetlands); impacts on air and water quality; impacts on commercial fishing; conflicts with military uses of the continental shelf; conflicts with ship traffic and navigation; and impacts on the recreational, historical, aesthetic and arechaeological features of the area. Potential mitigating measures include oil spill regulations, enforcement and contingency action, and construction of protective structures and pipelines. The unavoidable adverse environmental effects of the project were also described. (Gagliardi-Florida)

**CRUDE OIL AND NATURAL GAS PRODUCTION AND OTHER MINING OPERATIONS IN NAVIGABLE WATERS ALONG THE LOUISIANA COAST (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Army Engineer District, New Orleans, La.
Available from the National Technical Information Service, Springfield, Va 22161, USDC, as EIS-LA-73-1897-F, $10.50 in paper copy, $2.25 in microfiche. December 6, 1973. 403 p, 3 map, 4 tab.

Descriptors: *Permits, *Dredging, *Waste disposal, Navigation, Navigable waters, *Louisiana, Turbidity, Oil, Gasoline, Mineralogy, Environment, Fishing, Archaeology, Environmental effects, Fish, Navigation, Salinity, Marshes, Ecosystems, Disposal, Brines.
Identifiers: *Environmental Impact Statements.

The action involves the determination or acceptability of any request for a permit to erect or construct facilities to explore for oil or gas or to develop production and storage of such resources or other mineral resources in navigable waterways. The permit system provides for the orderly and efficient development of the mineral resources of the coast of Louisiana with due regard for minimization of the impact upon the environment. Dredging, spoiling and waste disposal, incident to proposals for which permits are granted, can reduce or expand aquatic and land habitats, alter hydrologic characteristics of areas, create turbidity and cause siltation, and expose, damage, or conceal archaeological sites. Regulation and surveillance systems now employed as well as improved industry awareness and cooperation are expected to minimize these and other impacts. The following adverse environmental effects will result: creation of obstruction to navigation and fishing activities; altered salinity and circulation of marsh areas; possible damage to ecosystems; dredging; and disposal of brines and

sanitary wastes. Alternatives are to cease issuing drilling, structural or dredging permits or to delay development of resources until all environmental problems have been resolved to the satisfaction of all concerned. (Gagliardi-Florida)

Descriptors: *Pollutants, *Pollution abatement, *Oil pollution, Oil industry, Oil spills, Oil wastes, Oil, State governments, Federal government, United States, Canada, Regional development.
Identifiers: International agreements.

The purpose of the plan is to provide for coordinated and integrated responses to pollution incidents by federal, state, provincial and regional plans of both the United States and Canada. The objectives of the plan are to develop appropriate measures of preparedness and systems for the discovery and reporting of pollution incidents, to institute prompt measures to restrict the further spread of oil or other noxious substances, and to provide adequate resources to respond to a pollution incident. The plan provides for pre-designated on-scene commanders and deputy commanders who will coordinate the response activities to control a spill and for joint response teams to provide advice and assistance to the on-scene commanders. Additionally, it establishes alerting and notification procedures, command structures, post-clean-up requirements and arrangements for assuming the responsibility for the cost of operation. The implementation and maintenance of the plan is the joint responsibility of the United States Coast Guard and Department of Transportation and the Canadian Marine Transportation Administration and Ministry of Transport. **THE RESERVE MINING CASE: PROMISES, PROMISES,**
Minnesota Pollution Control Agency, Minneapolis.
G. J. Merritt.
Great Lakes Focus on Water Quality, Vol 1, No 1, p 1-3, Fall 1974.

Descriptors: *Environmental control, *Environmental effects, *Lake Superior, *Air pollution, *Water pollution, Environment, Air, Air pollution effects, Water pollution control, Water pollution effects, Water pollution sources, Waste disposal, Wastes, Water, Asbestos, International Joint Commission.
Identifiers: *Hazardous substances(Pollution), Injunctive relief.

The difficulties and possible futilities inherent in the environmental movement are manifested by the case of Reserve Mining Company and its discharge of 67,000 tons a day of taconite tailings into Lake Superior. On April 20, 1974, Federal District Judge Miles Lord ordered the plant to cease its discharges into the air and water effective 12:01 a.m., April 21, 1974. Less than 48 hours later, it was ordered reopened by a hastily convened panel of 8th U.S. Circuit Court of Appeals judges. Nevertheless, it now appears certain that Reserve is going to have to recognize its public responsibility and end its dumping of waste materials, including possibly carcinogenic asbestos fibers, into the public air and water. The question still remains, however, when the dumping will eventually cease. Despite action by the Environmental Protection Agency and the International Joint Commission, admissions by Reserve officers that permit conditions have not been followed, and fears of cancer causation, the Supreme Court, on June 10, 1974, refused to overturn the 8th Circuit's stay. Corporate irresponsibility and refusal to accept blame is criticized. Only an enlightened public outcry will result in the cessation of this willful and dangerous pollution. (Gagliardi-Florida)

**WATER STRATEGY--STATEMENT OF POLICY FOR IMPLEMENTING CERTAIN REQUIREMENTS OF THE 1972 FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS.**
Environmental Protection Agency, Washington, D.C.
April 30, 1973. 74 p, 5 tab, 4 append.

Descriptors: *Federal Water Pollution Control Act, *Effluents, *Water pollution, *Water quality control, Federal project policy, Administration, Governmental interrelations, Long-term planning, Legislation, Coordination, Water policy, Permits, Discharge(Water), Pollution abatement, Estuaries, Sea water, Groundwater, States, Municipal wastes, Industrial wastes.
Identifiers: Effluent limitations, Federal Water Pollution Control Act Amendments of 1972, Inland surface waters, Point sources, Ocean dumping, Non-point sources.

An outline is presented of part of a management system conceived to implement the Federal Water Pollution Control Act Amendments (FWPCA) of 1972. The purpose is to provide the Environmental Protection Agency (EPA) and the states with a presentation of national objectives and relative areas of emphasis. The basic concern dealt with by the FWPCA Amendments is the control of point source pollution to achieve national water quality. This will be accomplished by the institution of a universal base level of effluent limitation supplemented by a higher level of effluent limitations dictated by water quality requirements. The current water quality problem in inland surface waters and estuaries, marine waters and ground water is discussed. Because the major sources of pollution and the level of effluent control needed differs by geographical area and because of budgetary constraints, the strategy is basically to attack water pollution in the areas where it is most serious and where it results principally from the discharges of point sources. The program is principally concerned with industrial and municipal discharges, ocean dumping and non-point sources. Future goals for the EPA and the states are presented, such as establishment by the states of the necessary water quality analysis procedures. (Altuve-Florida)

**ENVIRONMENTAL CRITIQUE (THE 1972 FEDERAL WATER POLLUTION CONTROL ACT: PROBLEMS AND PROSPECTS AFTER ONE YEAR),**
Natural Resources Defense Council, Washington, D.C.
J. G. Speth.
Natural Resource Lawyer, Vol 7, No 2, p 249-256, 1974. 17 ref.

Descriptors: *Federal Water Pollution Control Act, *Water pollution, *Wastes, Regulation, Control, Legal aspects, Institutional constraints, Pollutants, Navigable waters, Social values, Water quality, Law enforcement, Toxins, Scheduling, Planning, Timing, Research and development, Technology, Permits, Federal government, Government finance, Programs.
Identifiers: Point sources, Non-point sources, Impoundment(Funds).

The 1972 Amendments to the Federal Water Pollution Control Act have created a strong but workable regulatory program. The key goal of the Amendments is to restore and maintain the chemical, physical and biological integrity of the Nation's waters. This is to be achieved through implementation of six national policies stated in the Act; one of which is the elimination of the discharge of pollutants into the navigable waters by 1985. Other goals include swimmable and fishable water by 1983 and the speedy elimination of toxic discharges. The Amendments also include a regulatory program to implement the new national policies. The emphasis is upon a reasonable time table for implementation by means of the best practicable technology currently available. Implementation has been delayed by low federal funding and impoundment of funds. Environmentalists are disappointed with the Environmental Protection Agency's failure to publish a satisfactory list of toxic pollutants, its failure to totally control non-industrial point sources, and failure to issue needed guidelines. (Altuve-Florida)

**FEDERAL MARITIME JURISDICTION AND STATE MARINE POLLUTION LEGISLATION: THE FLORIDA ACT NOT PREEMPTED PER SE,**
Miami Univ., Fla. School of Law.
G. L. Adelman.
University of Miami Law Review, Vol 28, p 209-218, 1973. 69 ref.

Descriptors: *Oil spills, *Oil pollution, *Federal Water Pollution Control Act, Oil, Oil industry, Oil wastes, Pollution abatement, United States, Florida, Pollutants, Water, Water pollution, Water pollution control, Water pollution treatment, Water pollution sources, Water policy, Water quality, Water quality control, Navigable waters, Ships.
Identifiers: Absolute liability, Coastal waters, Hazardous substances(Pollution), Injunctive relief.

A three-judge federal district court for the Middle District of Florida enjoined the enforcement and operation of the Florida Oil Spill Prevention and Pollution Control Act, declaring it null and void as an intrusion into the exclusive federal domain of substantive maritime legislation. The Supreme Court unanimously revised, finding no federal preemption and no direct conflict between the Florida act and the Federal Water Quality Im-

provement Act (WQIA) of 1970. The Court found that the latter act neither touched the subject of the liability of a maritime oil polluter for injuries to property, nor contained any provisions for the recovery by a state of costs it might incur in the abatement and cleanup of oil discharged into the navigable waters of the United States. The Court acknowledged that a state may constitutionally exercise its police power respecting maritime activities concurrently with the federal government and legislate with respect to damages or injuries caused by a vessel on navigable waters, but consummated on land. Questions which might arise in the future concerning the Florida Act involve the effect of the limited liability provisions of the WQIA and of case law prohibiting state legislation which prejudices the characteristic feature of maritime law. (Gagliardi-Florida)
W75-09845

**INTERNATIONAL LAW AND CANADIAN ARCTIC POLLUTION CONTROL,**
J. J. Sherrin.
Albany Law Review, Vol 38, p 921-942, 1974. 130 ref.

Descriptors: *Canada, *Arctic, *Water pollution, *Water pollution control, Ice, Land, International law, Water pollution effects, Water pollution sources, Pollutants, Water quality, Water quality control, Water resources, Natural resources, Islands, Navigation, Ecology, International waters, Coasts, Oceans, Ships.
Identifiers: Coastal waters, Contiguous zone, International agreements, State policy.

On June 26, 1970, the Canadian Parliament passed the Arctic Water Pollution Prevention Act. The act is designed to ensure that the natural resources of the Canadian Arctic are developed and exploited and the Arctic waters adjacent to the mainland and islands of the Canadian Arctic are navigated in a manner cognizant of Canada's responsibility for the welfare of the Eskimo and other inhabitants of the Canadian Arctic. The scope of the act is quite broad and the penalties provided are stringent and far-reaching. Canada's reasons for choosing to act unilaterally on this matter, rather than awaiting international action, appear to be an increasing disillusionment and frustration with international processes. The act seems to be based upon a far-reaching contiguous zone theory and not on the theory that such waters are subject to Canadian sovereignty. The Act is attacked on two grounds: (1) that the requisite coastal state jurisdiction on the high seas does not exist, and (2) that the means of regulation chosen are inconsistent with international standards concerning passage of ships and freedom of the seas. As long as the Canadian government continues to meet acceptable standards of international administrative due process, the act will remain a legitimate exercise of jurisdiction into the high seas. (Gagliardi-Florida)

**ENVIRONMENTAL PROTECTION BY COASTAL STATES: THE PARADIGM FROM MARINE TRANSPORT OF PETROLEUM,**
Fordham Univ., Bronx, N.Y. School of Law.
J. C. Sweeney.
Georgia Journal of International and Comparative Law, Vol 4, No 2, p 278-306, 1974. 129 ref.

Descriptors: *International law, *Oil, *Oil pollution, *Oil spills, Environment, Environmental control, Sea water, International commissions, Coasts, International waters, Environmental effects, Navigation, Pollutants, Water, Oceans, Sewage, Drainage, Rivers, Rainfall, Industries.
Identifiers: Energy crisis, International agreements, Territorial seas(Jurisdiction), Territorial waters.

The principle of freedom of the high seas enunciated by Grotius is the theoretical foundation for the denial to any state, other than the state of the vessel's flag, of the right to interfere with the operations of a vessel on the high seas. However, the effect of the principle of absolute freedom of the high seas when applied to the problem of oil pollution of the oceans is either archaic or misleading. Although world order prefers a multilateral solution to the environmental problems caused by oil pollution, nevertheless the same world order will not condemn unilateral solutions which have the necessary effect of extending coastal state interference with navigation and trade on the high seas. It is believed that an emerging rule of international law permits endangered coastal states to take action to interfere with the operations of polluting vessels outside of territorial water. Although there are many sources of environmental damage to the oceans and the coastal zone, such as sewage, natural drainage, river systems and even rainfall, there is one source which is controllable--the ocean transport of petroleum. Unfortunately, the efforts to control this source can imperil one of the most important industries of industrialized economies. Therefore, the slow process of accommodation will be necessary to reach a viable solution. In the interim, in the interest of international uniformity and the progressive development of international law, the 1969 Civil Liability Convention and the 1971 Fund Convention should be ratified by the United States Congress. (Gagliardi-Florida)

**MARINE OIL SPILLS: A PROBLEM IN ENVIRONMENTAL MANAGEMENT,**
British Columbia Univ., Vancouver. Dept. of Economics.
P. G. Bradley.
Natural Resources Journal, Vol 14, p 337-359, 1974. 5 fig, 3 tab, 27 ref.

Descriptors: *Oil spills, *Water pollution, *Cost-benefit analysis, *Social values, Economic feasibility, Decision making, Economic efficiency, Planning, Cost analysis, Social needs, Regulation, Control, Penalties(Legal), Pollution abatement, Water pollution control, Administration, Programs, Law enforcement, Priorities, Institutional constraints, Oceans, Public benefits.
Identifiers: *Marine oil spills.

Marine oil spills, especially those occurring in connection with ocean transport of petroleum and offshore production, have attracted attention recently from various fields including politics, science, and law. Economics of the spill problem is discussed, focusing on the range of opportunities open to the industry for reducing spillage and incentives to encourage such measures. The problem can be attacked by reducing accidents that cause the spill and by reducing the spillage after occurrence of accidents. The presence of social values and costs in this problem makes it difficult to determine what economic cost should be borne to eliminate oil spills. One proposed solution has been the use of private tort actions. Private actions can serve a useful function but the ultimate solution will have to come after a serious weighing of social and economic costs and benefits. The establishment of a tribunal which would set environmental quality targets and an enforcement agency which would see those targets are reached in an efficient way are a proposed solution. Identifiers: *Urban water management, *Atlanta(Geo), *Multiple-objective planning, Communications barriers.

Very complex systems are required for urban water supply, drainage, and water quality control and yet urban water management practice is characterized by little use of modern tools for system design and operation. As an example, land use changes have a major effect on both water needs and water availability, and public goals are not being achieved because basic known systems concepts are not being used to understand, anticipate, or deal with them. In order to probe the barriers between developed analytic tools and practical planning applications, questionnaires were mailed to 60 persons with water or land resource planning and management responsibility in metropolitan Atlanta, Georgia. The responses were used to develop profiles that showed the various groups to possess basically the same training and experience except for the more technical functions of their particular agency; and yet the major problem identified was the need for better communications among managers of impacting land and water subsystems. Regular staff meetings and an activity reporting system were recommended. A method was proposed for ranking alternatives by a matrix in which goals would be weighted by Delphi Techniques. Available techniques for analyzing a number of design and operation problems relating to water quality con-

trol, floodplain management, water supply and stormwater management are tabulated and referenced. (Jones-Geo Tech)

**ECONOMICS AND FINANCE OF NEVADA PUBLIC WATER SYSTEMS,**
Nevada Univ., Reno. Desert Research Inst.
B. V. Dall, and H. H. Chen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 380, $4.75 in paper copy, $2.25 in microfiche. Nevada Center for Water Resources Research, Project Report No 34, May 1975. 81 p, 7 fig, 16 tab, 21 ref, 3 append. OWRT B-068-NEV(1). 14-31-0001-4104.

Descriptors: Water resources development, *Nevada, *Water supply, Management, *Rural areas, *Costs, *Water demand, *Water utilization, Coordination, Institutional constraints, Economics, Finance.

This study was initiated in response to a growing awareness of serious water management problems in rural communities of Nevada. Many small Nevada towns have stable populations and are faced with deteriorating water systems, rising costs for maintenance and investments, and an inadequate population base to support renovations. The major tasks of this study were to assess conditions of the water systems in the study area by compiling a comprehensive data base of water demand, usages, supply, and costs. Most all small communities and their water supply systems were not self-sufficient, discourage proper investment, and do not try and reduce consumption. The major problem prevalent in small communities in Nevada is the serious lack of coordination between institutional structures and community needs. An overall lack of cooperation between communities in regard to water problems and water system construction further hinders any progressive action within the state. (Fallon-Nevada)

**WATER FOR ENERGY SELF-SUFFICIENCY.**
Water Resources Council, Washington, D.C.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402 Price $2.70. October, 1974. 184 p, 31 tab.

Descriptors: *Comprehensive planning, *Institutional constraints, *Energy, *Hydroelectric power, *Water distribution(Applied), Water supply, *Water supply development, *Water quality, Colorado River Basin, Mississippi River, Power system operation, Water delivery, Water cooling, North America, Power plants, Planning, Arid lands, Semiarid climates, Decision making, Financing.

Recommendations are provided for a course of action to meet the energy-related water needs of the U.S. Projects, programs, and investigations are identified which can assist in meeting water requirements for needed energy development, not maximum development. Emphasis is on the availability of water supplies for exploration, extraction, processing, transporting and use of energy; generating hydroelectric power; domestic and industrial needs; and associated needs arising from new energy related developments. Analysis was done on a regional basis and potential actions are suggested to alleviate identified problems. Activities included solicitation, study, and consideration of state information and views on energy related goals, projects, priorities, and problems associated with water for energy development. Available from National Technical Information Service, Springfield, Va 22161 as COM-74-11559, $4.25 in paper copy, $2.25 in microfiche. July 1974. 58 p, 103 ref.

Descriptors: *Research and development, *Marine biology, Oceans, State governments, Mineralogy, Fisheries, Fish, Fishing, Research facilities, Research priorities, United States, Pollution abatement, Pollutants, Pollutant identification, Coasts, International law.
Identifiers: International agreements.

Various methods of research in marine affairs that are currently being undertaken in the United States are described. A substantial list is presented of principal researchers as a review of achievements and needs in this fast-moving field of study. The areas of marine affairs research are classified as national security policy, merchant marine and port policy, mineral policy, fisheries policy, pollution policy, and coastal zone and general policy issues. It id essential to the wise guidance of public policy for the coastal zone, the seabed, and the oceans that such research be maintained, and broadened to the point of decision-making at state, federal, and international levels. Compared to the investment of resources in marine sciences, research in marine affairs is infinitesimal. Yet the rewards for public welfare through well-informed policies as a result of marine affairs research can be enormous. (Gagliardi-Florida)

San Diego County Comprehensive Planning Organization, Calif.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-231 409, $4.25 in paper copy, $2.25 in microfiche. Prepared for Dept. of Housing and Urban Development, December, 1973. 61 p, 4 tab.

Descriptors: *Comprehensive planning, *Waste water treatment, *Sewerage, *Flood control, *Local governments, Facilities, Sewage treatment, Planning, Water resources development, Water utilization, *California.
Identifiers: *San Diego region(Calif).

Goals and policies are presented for the provision, planning, and extension of water, sewerage, and flood control facilities and services in the San Diego region of California. A summary of an evaluation of the adequacy of the existing facilities to meet present and projected 1981 requirements and a list of proposed projects which are partly based on this evaluation are also presented. The introduction explains San Diego County and the Comprehensive Planning Organization; part 2 sets forth the goals and policies to guide the planning and development of water, sewerage and flood control facilities; part 3 discusses the adequacy of the water resources and existing water resource facilities in the region; part 4 outlines improvements as well as financial considerations, and, part 5 discusses the implementation of the systems in relation to governmental responsibilities and organization. **WATER LAWS IN MOSLEM COUNTRIES,**
Food and Agriculture Organization of the United Nations, Rome (Italy). Land and Water Development Div.
D. A. Caponera.
Food and Agriculture Organization of the United Nations, Rome, Irrigation and Drainage Paper No 20/1, 1973. 223 p, 118 refs.

Descriptors: *Water resources, *Water law, *Legislation, *Water rights, Legal aspects, Water resources development, Arid lands, Asia, Africa, Irrigation, *Reviews.
Identifiers: *Moslem water law, Afghanistan, Bahrain, Brunei, Iran, Jordan, Kuwait, Morocco, Qatar, Somalia, Tunisia, The Peoples' Democratic Republic of Yemen, Yemen Arab Republic.

This is a revision of FAO Agricultural Development Paper No. 43, 'Water Laws in Moslem Countries' published in 1954. The earlier paper has been outdated by changes in water law and by the emergence of many new nations in the Moslem world. In this, volume one of a two volume update, a general introduction is given and twelve nations (Afghanistan, Bahrain, Brunei, Iran, Jordan, Kuwait, Morocco, Qatar, Somalia, Tunisia, The Peoples' Democratic Republic of Yemen, and the Yemen Arab Republic) are described. Since Moslem law is based upon revelations transmitted from Allah to man through the agency of the Prophet Mohammed, its religious overtones are unmistakable and Western planners must expect plans to be suspect which ignore or contradict this divine law. Moslem law has faced the practical problems of dividing a limited resource among the populace; however, it should be remembered that the scarcer the water is, the more complicated and elaborate the regulations are. Modern tendencies in Moslem water law make water a national resource under central control and ownership. This is compatible with traditional Islamic thinking which has always viewed the concept of community interest as the basis of Moslem water law. (Bowden-Arizona)

**BOROUGH OF MORRISVILLE V. DELAWARE RIVER BASIN COMM'N. (RULING ON MOTION TO DISMISS ACTION BY COMMUNITIES DEPENDENT ON DELAWARE RIVER BASIN COMM'N. WHICH ACTION WAS FOUNDED ON A NEPA COMPLAINT).**
382 F. Supp. 543-547 (E.D. Penn. 1974).

Descriptors: *Delaware River Basin Commission, *Water supply, *Water allocation(Policy), *Water costs, Delaware, Delaware River, Rivers, Water demand, Basins, Water supply development, Water policy, Water rates, Water requirements, Water resources, Water users, Pennsylvania, Environmental effects, Environment.
Identifiers: *Environmental Impact Statements, NEPA, Injunctive relief.

A number of communities which depended upon the Delaware River Basin Commission for their water supply filed suit to prevent that agency from imposing a charge for water use. The agency moved to dismiss the complaint. The United States District Court for the Eastern District of Pennsylvania held that jurisdiction for plaintiffs' National Environmental Policy Act (NEPA) complaint could be properly founded upon a federal mandamus statute since the administrative action sought to be compelled or restrained was essentially ministerial rather than discretionary. The court rejected an argument that there was no case or controversy on grounds that the fees had not yet been collected. NEPA requires the preparation of an environmental impact statement for all legislative proposals and other major federal actions significantly affecting the quality of the human environment. **UNION CAMP CORP. V. SEMINOLE FOREST WATER MANAGEMENT DISTRICT (SUIT BY SINGLE LANDOWNER TO REQUIRE FORMATION OF A DRAINAGE DISTRICT).**
302 So. 2d 419-423 (1st D.C.A. 1974).

Descriptors: *Florida, *Drainage districts, *Judicial decisions, *Wetlands, Legal aspects, Nonstructural alternatives, Water management(Applied), Local governments, State governments, Legislation, Land tenure, Overflow, Water districts, Water control, Drainage.
Identifiers: *Standing(Legal), *Contiguous zone.

Petitioner, a corporate landowner, filed for the formation of a drainage district pursuant to Chapter 298 of the Florida Statutes, which provides that 'owners of the majority of the acreage of any contiguous body of wet or overflowed land or lands subject to overflow' may petition for the creation of a district. Petitioner's lands constituted a contiguous part of an area that is subject to overflow. The State of Florida, the County of Volusia, several adjacent landowners, and owners of lands within the proposed district filed objections. Central to the controversy was whether the statute required a petition by the owners of a majority of the acreage of lands within the proposed district or whether it required a petition by the owners of a majority of the acreage of a contiguous body of lands subject to overflow. The First District Court of Appeal of Florida construed the statute as requiring merely that the lands within the proposed district must be contiguous, and held that a single landowner, such as petitioner, could

apply for the incorporation of a district, but that parties whose lands were within the proposed district must be included in the controversy. The court also held that the adjoining landowners and the county had standing to intervene, while the state did not. (Fernandez-Florida)

**JOHNSON V. STATE FARM FIRE AND CASUALTY CO. (ACTION FOR DEATH BY DROWNING IN ARTIFICIAL CANAL WHICH WAS FOUND TO BE NOT NAVIGABLE).**
303 So. 2d 779-787 (Ct. App. La. 1974).

Descriptors: *Drowning, *Canals, *Navigation, *Negligence, Rivers, Streams, Fishing, Boats, Boating, Navigable rivers, Navigable waters, *Louisiana.
Identifiers: Proximate causation.

An action was brought for the death of the decedent who drowned after being thrown from a fishing boat while the boat's motor was being operated by the defendant's insured. The Louisiana Court of Appeal held that rivers and streams are regarded as public navigable rivers when they are navigable in fact or are susceptible of use in their ordinary condition as highways of commerce over which trade or travel may be conducted in the ordinary mode of trade or travel on water. An artificial canal, however, can not be presumed navigable even though it might be deep enough to float a pirogue or flat-bottomed fishing boat. The court held the waterway in which the accident happened nonnavigable. It also held the insured negligent and the deceased not contributorily negligent. (Gagliardi-Florida)
W75-09829

**PEOPLE V. MCCARTHY (CRIMINAL ACTION FOR OPERATING UNREGISTERED BOAT ON NAVIGABLE WATERS OF PRIVATELY OWNED MARINA).**
362 N.Y.S.2d 785-787 (Crim. Ct. City N.Y. 1974).

Descriptors: *Boats, *Boating regulations, *Navigable waters, Highways, Land, Water law, Marinas, *New York, Boating, Water, Navigation, Trafficability.
Identifiers: State policy.

Defendant was charged with operating an unregistered and unnumbered boat upon navigable waters. The Criminal Court of New York City, reasoning that a navigable waterway is akin to a public highway and therefore subject to regulation by the state under its police powers even though the land under the water is privately owned, held that the defendant as lessee of a marina had only a right of possession, and that ownership still resided in the city. Because the state cannot yield its sovereign power and public obligation in regard to navigable waterways, the court held that the defendant-lessee was not entitled to operate an unregistered and unnumbered boat upon a navigable marina under a statute excluding from registration requirements motor boats operated upon waters privately owned. (Gagliardi-Florida)

**PASSAIC VALLEY COUNCIL BOY SCOUTS OF AMERICA V. HARTWOOD SYNDICATE, INC. (SUIT BY OWNER OF PART OF RESERVOIR BED AGAINST OWNER OF REMAINDER WHO CLAIMED EXCLUSIVE RIGHT TO HUNT, FISH OR SAIL ON RESERVOIR WATERS).**
361 N.Y.S.2d 945-949 (Sup. Ct. App. Div., 3d Dept., 1974).

Descriptors: *Reservoirs, *Easements, Beds, Canals, Fishing, Hunting, Boating, *New York, Dams, Drains, Water, Streams, Rivers, Recreation, Recreation demand.
Identifiers: Evidence, Injunctive relief.

An action was brought by plaintiff as owner of a portion of a reservoir bed under deed from a canal company, claiming rights in the reservoir against defendants, one of whom owned the remainder of the bed and who claimed rights in the reservoir pursuant to a canal company's conveyance of the canal and an earlier grant of hunting, fishing and sailing rights. The New York Supreme Court, Appellate Division, held that determination of whether rights reserved by the canal company in the latter conveyance constituted an easement appurtenant or an easement in gross required a construction of the intent of the parties from the face of the instrument and, in event of ambiguity, examination of the surrounding circumstances. The court found that the deed conveying perpetual and exclusive rights to hunt, fish and sail on the reservoir did not give the defendant the right to exclude plaintiff from undertaking such activities in the area. (Gagliardi-Florida)
W75-09831

**CONCH CREEK CORP. V. GUESS (CONFLICTING TITLE CLAIMS TO TIDELANDS INCLUDED IN GRANT FROM GOVERNOR).**
209 S.E.2d 560-561 (S.C. 1974).

Descriptors: *South Carolina, *Tidal marshes, *High water mark, *Navigable waters, *Ownership of beds, Judicial decisions, Legal aspects, Legal review, Water law, Boundary disputes, Governments, Public rights, Tidal effects, Tidal streams, Land tenure.

Plaintiff, landowner, brought suit against the State of South Carolina to quiet title to 398 acres of marshland. The property was located between two navigable waterways and was below the high water mark. The 398 acres was part of a larger tract which the plaintiff's predecessor had received in a grant from South Carolina. The property in the grant was specifically described to include the 398 acres and all of the granted property was tideland. The defendant demurred and the trial court overruled holding that title was in the plaintiff. On appeal the State contended that title to land below the high water mark on tidal navigable streams is in the State and is not transferable unless the State specifically does so. The appellate court affirmed the trial court stating that the grant of 645 acres all of which were tidelands was specific enough to indicate the State's intent to transfer title. The court felt there was no reasonable purpose for the grant unless it was to convey title to the plaintiff's predecessor. (Altuve-Florida)

**FLORIDA WATER RESOURCES ACT OF 1972 (STATUTE ESTABLISHING WATER MANAGEMENT DISTRICTS FOR THE STATE OF FLORIDA).**
Fla. Stat. Ch. 373, sec. 373.012 thru 373.6161 (1973).

Descriptors: *Permits, *Water policy, *Water management(Applied), *Florida, Local governments, State governments, Groundwater, Groundwater recharge, Surface waters, Water resources, Water shortage, Water supply, Water table aquifers, Water wells, Water law, Water levels.
Identifiers: *State policy, Florida Water Resources Act of 1972.

The Florida Water Resources Act of 1972 was enacted in recognition of the importance of water resources to the State, and the necessity for conservation and control in order to realize their full beneficial use. Among the purposes of the Act are management of water and land resources, the promotion of conservation and proper utilization of surface and ground water, and the preservation of natural resources, fish and wildlife. The Act vests in the Department of Natural Resources, the power and responsibility to implement the purposes of the Act, as well as the authority to delegate appropriate powers to the various water management districts in furtherance of the aims of the Act. The Department has authority to exercise supervisory authority over all water management districts, as well as to exercise any power which may be exercised by a water management district. The Department is directed to proceed as rapidly as possible to study existing water resources and to cooperate with the division of state planning to formulate a comprehensive state plan for the use and development of the waters of the state. The Department and district governing boards are authorized to promulgate regulations necessary or convenient to administer the provisions of the Act. (Denvir-Florida)
W75-09833

**ARTIFICIAL ISLANDS AND INSTALLATIONS IN INTERNATIONAL LAW,**
Rhode Island Univ., Kingston. Law of the Sea Inst.
A. H. A. Soons.
Occasional Paper No 22, July 1974. 30 p, 76 ref, append.

Descriptors: *International law, *International waters, *Law of the sea, *International Boundary and Water Commission, *Islands, Governments, Federal government, Federal jurisdiction, Jurisdiction, Oceanography, Oceans, Shores.
Identifiers: Territory, *Artificial islands.

Legal aspects are discussed of the existence of artificial structures which do not float but are permanently above sea level and of structures which rest upon the seafloor by means of piles or tubes driven into the bottom. The permissibility of constructing artificial islands and installations in internal waters, the territorial sea, and the high seas, respectively, is analyzed, before a discussion of legal ramifications of the construction of such bodies on the legal regimes of surrounding waters is undertaken. The possible effects of the presence of such bodies on delimitation of the territorial sea is also explored. The exercise of jurisdiction to regulate activities on artificial islands and installations is discussed, with a distinction being made between the various jurisdictional zones of the ocean. Finally, draft articles which could be included in a treaty on the law of the sea are presented. (Gerlach-Florida)

**OFFSHORE OIL AND GAS RIGHTS: A COMPARATIVE STUDY,**
M. Crommelin.
Natural Resources Journal, Vol 14, No 4, p 457-500, 1974. 1 tab, 237 ref.

Descriptors: *Gases, *Oil, Canada, Environment, Oil industry, Oil reservoirs, Oil pollution, Land, Sea water, United States, Australia, Marine geology, Economics, Economic efficiency, Fuels.
Identifiers: Coastal waters.

The last decade has witnessed a dramatic shift in the focus of world oil and gas exploration and development from the land to the sea. The offshore oil and gas regimes of the United States, the United Kingdom, Canada and Australia are examined to assess their effectiveness in the management of publicly-owned resources. The allocation process of each country and the nature of the rights acquired in each jurisdiction are thoroughly considered and described. Additionally, the four management systems are compared and contrasted as to their relative merits and

deficiencies. The role of government in the management of offshore oil and gas resources is bound to increase in the future. Public ownership of these resources, their location within a complex marine environment, and their growing importance to economic development make this result inevitable. The alternative forms that government intervention will take are either the establishment of a flexible and efficient management regime controlling the activities of private enterprise or direct governmental participation. **NATIONAL AUDOBON SOCIETY V. WHITE (SUIT TO ENJOIN TRESPASS ON PRIVATELY OWNED AND MAINTAINED NAVIGABLE CANAL).**
302 So. 2d 660-668 (La. Ct. App. 3d Cir. 1974).

Descriptors: *Louisiana, *Trespass, *Public access, *Riparian rights, *Canals, Legal aspects, Easements, Public rights, Navigable waters, Permits, Judicial decisions, Land tenure, Right-of-way, Riparian land, Water rights, Prescriptive rights, Legislation, Water law, Equity.
Identifiers: Injunctive relief, Navigation obstruction, Water rights(Non-riparian).

Plaintiffs sought to enjoin defendants from trespassing on a canal located on plaintiff's land. The issue presented was whether a private landowner can prohibit others from using a navigable canal constructed by him on his own property. Plaintiffs contended that the canal is private and that they have the right to restrict the use of the canal. They conceded the defendants previously were granted permission to use the canal, but argued that permission was later withdrawn. Defendants alleged that the canal is a public waterway and plaintiffs have no right to restrict the use of it. They further contend that plaintiffs are barred by Louisiana statute from obstructing a navigable waterway. Granting injunctive relief, the Court of Appeal of Louisiana, Third Circuit, held that a canal which was constructed with private funds on private property, which was posted and which had been open for public use only by written permission was a private canal subject to the owner's right to regulate its use. Further, the court concluded that the statute which prohibits obstruction of a highway of commerce did not apply, even though the canal was navigable. (Fernandez-Florida)
W75-09839

**CONSERVATION COUNCIL OF NORTH CAROLINA V. COSTANZO (ACTION TO ENJOIN CONSTRUCTION OF A MARINA ON ISLAND IN ATLANTIC OCEAN AND TO REQUIRE ENVIRONMENTAL IMPACT STATEMENT BY CORPS OF ENGINEERS).**
505 F.2d 498-502 (4th Cir. 1974).

Descriptors: *North Carolina, *Judicial decisions, *Administrative agencies, *Constitutional law, Legal aspects, Legal review, Law enforcement, Social aspects, Social needs, Social values, Recreation facilities, Recreation demand, Beds, Marinas, Coastal structures, Environmental effects, Regulation, Public rights, Construction.
Identifiers: *Environmental Impact Statements, *Standing(Legal).

Plaintiff, a conservationist group in North Carolina, sought a preliminary injunction restraining a developer from further construction of a marina on Bald Head Island and an order requiring the District Engineer of the Army Corps of Engineers to prepare and file a detailed environmental impact statement. The District Court denied the motion for preliminary injunction and dismissed the action for want of standing. The Court of Appeals affirmed on the ground that to have standing to seek judicial review of agency action, the plaintiff must allege an individualized interest at stake which would place him among the injured. The plaintiff's claim of potential loss of recreational use of the island as a licensee or trespasser was not sufficient to confer standing. The court did find merit in the plaintiff's claim that the construction would interfere with the right to travel through or otherwise use navigable portions of the submerged land and remanded. **TOWARDS A NEW REGIME FOR OCEAN DEVELOPMENT,**
Tohoku Univ., Sendai (Japan). School of International Law.
S. Oda.
Ocean Development and International Law Journal, Vol 1, No 3, p 291-302, 1973. 25 ref.

Descriptors: *Law of the Sea, *Marine fisheries, *Commercial fishing, *Continental shelf, Coasts, Oceans, Navigation, United Nations, Foreign countires, Governments, International law, Manganese, Foreign trade, Foreign waters, International waters, Water law, Conferences, Fishing, Jurisdiction, Legislation.
Identifiers: *Coastal waters, *Territorial waters, Territorial seas(Jurisdiction), Ocean development, Seabeds.

In light of the great benefits that Japan has received under traditional concepts of the freedom of the high seas, Japan should not close its eyes to the changing concept of the law of the sea, particularly in the field of resources management. Two distinct trends are described: first, the growing interest of coastal states over offshore resources, which may be satisfied only through the exercise of coastal jurisdiction, and second, the aspirations of a number of countries toward international control of the resources of the vast ocean areas, which may eventually replace the concept of free competition. Neither extreme will prove satisfactory, since the implementation of one scheme will ignore competing needs. A new and flexible approach is needed to enable an over-all accommodation of the diverse interests involved. The division of the sea into the traditional concept--the high seas and the territorial sea--will no longer prove satisfactory in view of present-day problems of the sea. A pragmatic basis is proposed for narrowing the differences that exist between the realities and the ultimate objectives of the international community. (Fernandez-Florida)

**INFLUENCE OF THE ENERGY CRISIS UPO THE FUTURE OF ENVIRONMENTAL POLICY**
Committee on Interior and Insular Affairs (U.S Senate).
D. A. Dreyfus, and R. D. Grundy.
Environmental Affairs, Vol 3, p 252-274, 1974. 5 ref.

Descriptors: *Social values, *Institutional con straints, *Conservation, *Environmental effects Social needs, Social impact, Economic impact Economic justification, Political aspects, Politica constraints, Research and development, Energy budget, Energy, United States, Legal aspects Legislation, Regulation, Control.
Identifiers: Energy needs.

The present energy crisis has emphasized the long standing conflict between energy needs and environmental goals and the need for changing energy consumption patterns. The United States intensive use of energy is closely linked to its high standard of living and the present rate of consumption indicates that in the future the energy shortage will become even more acute. In order to meet the present crisis, certain national policies will have to be restructured. The newest policies, particularly those involving environmental constraints, will be amended or revoked because they have not yet been incorporated into the structure of the energy systems or the cultural and economic structures of society. Three areas where such restructuring of policies will probably take place are federal decisions on surface mining, the Alaska pipeline, and emergency energy measures. Despite this restructuring it is highly unlikely that any major body of environmental law will be stricken from the statutes, because environmentalism has become too well established in society. **THE PUBLIC TRUST DOCTRINE IS ALIVE AND KICKING IN NEW JERSEY TIDAL-WATERS: NEPTUNE CITY V. AVON-BY-THE-SEA--A CASE OF HAPPY ATAVISM,**
Louisville Univ., Ky. School of Law.
L. R. Jaffee.
Natural Resources Journal, Vol 14, p 309-335, 1974. 137 ref.

Descriptors: *Public access, *Usufructuary right, *Tidal waters, Access routes, Beaches, Navigation, Fisheries, *New Jersey, Public rights, Shores, Recreation, Water, Water purification, Water quality, Water demand, Water policy, Water resources, Roads, Fishing.
Identifiers: Public trust doctrine, Administrative regulations, Standing(Legal).

Neptune City v. Avon-By-The-Sea holds that the public trust doctrine prohibits the state of New Jersey and its subdivisions from discriminating among state citizens in its foreshore access regulations. The decision apparently also secures citizen access to foreshore at points of intersection with dedicated public ways. Neptune City also suggests that the public may have rights of wetbeach access over private drybeach, as well as usufructuary rights respecting wetbeach allocated to private possession. In addition, no person or branch of state government can abridge citizen navigation, fishery, recreation, access and water purity interests. The case also stands for the proposition that New Jersey citizens have standing to challenge private and state-government threats to such tidal water interests. Absolute power to cut off citizen foreshore access by realty grant, or to plan roads not to connect with foreshore cannot, consistently with the public trust doctrine, vest in any branch or arm of the state government. Although principally related to navigation, fishing and attendant interests, the public trust is defined by actual citizenry demand. In order to fully protect citizen remedies, creation is recommended of a special tidal water resource allocation court with technological, scientific and economic expertise as well as juridicial competence, and the power to review legislative and quasi-legislative findings. ## G. Ecologic Impact Of Water Development

**ARIZONA'S REMOTE SUBDIVISIONS: AN INVENTORY,**
Arizona State Office of Economic Planning and Development, Phoenix. Planning Div.
M. Hamernick, and B. A. Brown.
January 1975, 39 p, 15 fig, 9 tab.

Descriptors: *Arizona, *Surveys, *Planning, Land use, *Land development, *Recreation demand, *Colorado River, Projections, Environmental effects, Rural areas.
Identifiers: *Subdivisions.

The basic inventory reveals the magnitude of remote subdividing activity and its effect on Arizona's environment. The statistics show 2,565 remote subdivisions on 943,460 acres cut up into 12,829 lots, of which 83% has been so subdivided since 1959. The supply of lots is far in excess of the estimated population increase projected to the year 2,000. Widely scattered throughout the state, these lands are sparsely settled, in many instances located at a distance from urban retail trade and service areas and some in areas with apparent water supply and flooding problems. Although there is little evidence that these aspects are likely to change, there is still a significant amount of private land that will obviously be subdivided in future. Attention is specifically directed to the 750-mile-long Colorado River, a major water recreation area, where nearly 40,000 acres have already been subdivided into 69,000 lots within 10 miles of the Arizona side of the River. **EVALUATING EFFECTS OF WATER RESOURCE DEVELOPMENTS ON WILDLIFE HABITAT,**
Missouri Dept. of Conservation, Jefferson City.
C. Daniel, and R. Lamaire.
Wildlife Society Bulletin, Vol 2, No 3, p 114-118, Fall, 1974. 2 tab.

Descriptors: *Wildlife habitats, *Water resources development, *Numerical analysis, *Land use, Wildlife conservation, Statistics, Habitat improvement, Environmental effects, Population, Evaluation.

A system is presented for evaluating effects of water resource development projects on wildlife habitat, based upon existing habitat values rather than on man's utilization of wildlife. Effects of water resource projects on wildlife habitat are summarized numerically, and unique habitat types and endangered fauna or flora are considered. Credit can be given for project benefits as well as losses. The amount of mitigation needed is determined by the same evaluation procedures. The basic philosophy of the system is that all land has an existing wildlife habitat value that can be expressed numerically. (Bowden-Arizona)

**THE ECOLOGICAL MANAGEMENT OF ARID AND SEMI-ARID RANGELANDS IN AFRICA AND THE NEAR EAST: AN INTERNATIONAL PROGRAMME.**
Report on an Expert Consultation, held May 27-31, 1974, Food and Agriculture Organization of the United Nations, Rome, Italy, 1974. 52 p, 6 append.

Descriptors: *Africa, *Carrying capacity, *Climatic data, *Drought, *Arid lands, Asia, United Nations, Ecosystems, Range management, Human population, Research priorities, Governments, Planning, Land use.
Identifiers: Overpopulation, Overgrazing.

Africa and the Near East contain the world's largest expanse of arid and semi-arid rangeland; recent droughts and famine have pointed out that this expanse has several problems of overpopulation, overgrazing and poor land use. The ecological balance of the region is fragile and with few exceptions, recent attempts to develop sedentary live-stock operations similar to those of arid regions of Australia or America have failed. Future exploitation of the region should be limited to a level that the land can support. If this is not done, future droughts will worsen the situation and further limit the region's ability to sustain human and animal life. The Food and Agriculture Organization can help nations in the region by providing the expertise for discovering just what level of exploitation is ecologically sound. Nations in the region must setup agencies to enforce such guidelines. It is concluded that the only way to alleviate human suffering during the recurring droughts that occur in the region is to lower human numbers and human use. (Bowden-Arizona)

**A SURVEY OF THE NESTING HABITATS OF THE WHITE-WINGED DOVE IN ARIZONA,**
Arizona Game and Fish Dept., Phoenix. Research Div.
D. D. Wigal.
Special Report No 2, June, 1973. 37 p, 10 fig, 8 tab, 3 append.

Descriptors: *Arizona, Riparian land, *Tamarisk, *Mesquite, *Nesting cover, *Game birds, *Wildlife habitats, Flood control, Habitats, Wildlife conservation, Habitat improvement, Water reuse.
Identifiers: *White-wing doves.

This study was begun in 1968 when virtually every mile of riparian woodland habitat important to doves was either being cleared, was authorized for clearing, or was being studied for eventual clearing. This habitat destruction was justified by flood control, water salvage, or both. These riparian habitats are the most successful nesting areas for white wing doves. Removal of salt cedar and mesquite thickets will possibly threaten the doves as an important game species for hunters although lower populations will be secure because inferior nesting habitat is not immediately threatened. A conflict exists between destroying riparian habitats for flood control and water salvage and maintaining white dove populations at a level sufficient for widespread hunting. (Bowden-Arizona)

**DROUGHT IN THE GHANA SAVANNAH: A REPORT TO THE U.S. AID MISSION TO GHANA,**
Arizona Univ., Tucson. Office of Arid Lands Studies.
J. D. Johnson.
1974, 5 p.

Descriptors: *Drought, *Africa, *Soil erosion, *Burning, *Arid lands, Forecasting, Human population, Forest management, Range management, Deserts, Agriculture, Climatic data, Research facilities, Research priorities, Remote sensing, Water supply, Carry capacity, *Grasslands, Land use.
Identifiers: *Ghana's Savannah.

The effects of the current drought in the Sahelian zone of Africa on the future of Ghana are explored. While rainfall has not declined in the savannah belt of Ghana, some features of desertification have appeared; increasing soil erosion, loss of forest vegetation, decline of groundwater, drying up of once perennial streams, and reported losses in soil fertility. Also, famine in the Sahel has put pressure on the nation's food resources and necessitated government patrols to control immigration. Possibly, some of the areas's degradation is the result of the use of burning by local farmers. In some areas overgrazing is a problem. By acting now, Ghana, can heighten chances of halting or reversing the desertification process in the savannah belt. Several recommendations are made: research on the area should be integrated; a documentation center should be established; an extension service suitable to the region's farmers should be created; more data must be collected; burning should be curtailed; the carrying capacity of the land should be determined; remote sensing methods should be utilized for automated mapping; various water harvesting methods should be studied and compared; major problems should be identified and given priority. (Bowden-Arizona)

**DETERIORATION OF THE ECOLOGICAL EQUILIBRIUM IN THE ARID ZONES OF NORTH AFRICA,**
H. N. Le Houerou.
Food and Agriculture Organization of the United Nations, Rome, Italy (1974). 11 p, 1 tab, 39 ref.

Descriptors: *Drought, *Africa, *Balance of nature, *Flood frequency, *Arid climates, Climatic data, Human population, Exploitation, Ecology, Ecosystems, History, Livestock, Range management, Climatology, Environmental effects, Deserts.
Identifiers: *Desertification, Overgrazing, Morocco, Algeria, Tunisia, Libya.

The arid zone of North Africa is considered those parts of Morocco, Algeria, Tunisia and Libya lying

between the 400 mm and 100 mm isohyets. Ecological equilibrium is essential for the sustained productivity of ecosystems; this balance has been broken almost everywhere in the arid zone of North Africa. This break is due to a sharp increase in population since about 1930, a six fold increase since the beginning the the century. Man and his animals have exceeded the carrying capacity of the land. The deterioration of the ecological equilibrium of the past centuries has resulted in expansion of the desert, in decreased production and productivity of the natural or artificial ecosystems. Huge tracts of land have become useless for man and his livestock as a result of erosion; and catastrophic floodings are throught to occur much more often than in the past. There is no evidence so far that the climate has grown more arid in the last century. Thus, the worsening condition of the region is the result of human exploitation, not of climatic change altering the amount of water available. (Bowden-Arizona)

**FLUID SAMPLING DEVICE,**
Houma Valve Service, Inc., La. (assignee)
M. A. Soudelier.
United States Patent 3,812,722. Issued May 1974. Official Gazette of the United States Pat Office, Vol 922, No 4, p 1074, May, 1974. 1 fig.

Descriptors: *Patents, *Sampling, Water analy *Equipment, Liquids, Conduits.
Identifiers: *Fluid sampling device.

Fluid is sampled as it flows through a conduit repeated expansion of a pressure chamber in elongated tubular housing. This is projected i the flow conduit through a sampling outlet wh is releasably clamped to the housing. A press chamber is formed between an inlet check va and reciprocating piston, mounted on a discha check valve, through which fluid travels to passage in the piston plunger during contraction the pressure chamber. Responding to a predet mined pressure of the fluid in the plunger passa a relief valve carried by the plunger opens supply a fluid sample. (Leibowitz-FIRL)

.25 in paper copy, $2.25 in microfiche. Montana niversity Joint Water Resources Research nter, Bozeman, Completion Report, December 74. 7 p, 3 ref. OWRT B-014-MONT(1).

scriptors: *Instrumentation, *Telemetry, lectronic equipment, *Data collections, Mon-a, Remote sensing, Research and development, easurement, Control systems.
ntifiers: *Data acquisition systems, Bridger a center.

e principal objective was to continue the velopment of digital instrumentations and metry for water resources research. Con-erable study was made as to the specifications the remote instrument package. Several tom data acquisition systems were built for ious sponsors and the experience gained in se developments was used in the prototype elopment used in this study. From the system ign has come the specifications, design, and elopment of a number of system components. ASR33 teletype has been modified to inter-e to other system components. A digital clock multiplexor has been developed that outputs standard time record each time a control signal pplied to the multiplexor control input. Several smitter and receiver units have been incor-ated in remote data acquisition systems rated by other agencies. For example, the Soil servation Service is using them in their Mon-snow survey network and the Northern Plains and Water Research Laboratory (ARS) is g a half duplex radio link to their remote er. **THER SATELLITE PICTURE RECEIVING IONS, APT DIGITAL SCAN CONVERTER,**
nal Aeronautics and Space Administration, belt, Md. Goddard Space Flight Center.
Vermillion, and J. C. Kamowski.
Technical Note D-7994, May 1975. 106 p, 1 tab, 1 ref, 5 append.

ptors: *Cloud cover, *Radio waves, lites(Artificial), Clouds, Meteorological Radio communication systems, Radioecolo-eteorology, Weather patterns, Digital com-Weather, Linear programming, Photog-Aircraft.
iers: *Automatic Picture Transmission, ng radiometers, Digital scan converter.

The Automatic Picture Transmission (APT) Digital Scan Converter is used at APT ground stations to convert signals received from APT scanning radiometers to data compatible with ground equipment designed to receive signals from APT vidicons aboard operational meteorological satellites. All information necessary to understand the circuit theory, functional operation, general construction, and calibration of the converter was presented. Brief and detailed descriptions of each of the individual circuits were also given. Each description was accompanied by a schematic diagram. Listings of integral parts and testing equipment required as well as an overall wiring diagram were included. This unit, which can be constructed from locally procured, low-cost components, when connected between the RF receiver and the output display unit as the ground station, will enable the user to readily accept and process, as required, weather photographs from operational meteorological satellites. (Roberts-ISWS)
W75-09588

**DEVICE FOR UNDERWATER OBSERVATION,**
J. F. Clark.
US Patent No 3,879,953, 4 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 933, No 5, p 1966, April 29, 1975.

Descriptors: *Patents, *Underwater, *Turbidity, Water pollution, Water quality, Equipment.
Identifiers: *Underwater observation.

This invention permits observation of objects in a turbid underwater environment. The invention comprises an enclosure which can be fitted around at least a portion of an underwater object which it is desired to observe visually or photographically. The enclosure can be pumped so that the environmental water in it is circulated through a filter to clear the water, or the environmental water can be pumped out and clear water pumped to replace it. The device is made from pieces of clear plastic which are joined together in a watertight manner. It includes hose fittings, pump and filter. (Sinha-OEIS)

J. P. McCraren, and R. M. Jones.
Prog Fish-Cult, Vol 35, No 2, p 81, 1973, Illus.

Descriptors: Spawning, Fish reproduction, Evaluation.
Identifiers: *Goldfish(Fantail), Maintenance, *Spawning mats, Nylon bristle brushes.

Spawning mats for fantail goldfish were constructed using newly developed nylon bristle brushes. The mats required less maintenance and were more durable and easily handled than the widely-used moss mat. No preference between mat types was displayed by spawning goldfish.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Distribution systems, Design, Programming languages, *Computer models, *Computer programs, *Hydraulic conduits, *Irrigation, Systems engineering, *Water distribution(Applied), Transmission lines, Fluid mechanics, Flow, Optimization, *Dynamic programming, Networks
Identifiers: *Fluid transport system, Interactive Fortran language.

A computation technique based on the dynamic programming approach using the interactive Fortran language has been developed. The computerized design procedure can be used to obtain optimal design for single source water or other compressed fluid systems with a finite number of diverging branches and loops. Pumping effect on a single source system cannot be optimized; however, the developed procedure does allow quick evaluation of many alternate pumping pressure. Similarly, multiple source network with converging branches can only be evaluated by the repeated use of the computerized procedure. Dynamic programming has been proved to be very powerful for the analysis and design of a water network. From an engineer's point of view, this approach can be used to design any conceptual water network with little limitaion.

[illegible] Inst., Copenhagen. Computa- [illegible] Center.
[illegible] and A. A. Smith.
Journal of Hydraulics Research, Vol 13, No 1, p [illegible].

Descriptors: *Information retrieval, *Water resources, *Information exchange, *Computer programs, Data storage and retrieval, Documentation, Indexing.

At the fifteenth International Association for Hydraulic Research congress, a task committee was established for information, documentation, and liason of information exchange on water resources computer programs. The committee objectives were: (1) to collect and compile information concerning available computer programs for solution of water resources engineering problems, (2) to make this information available in a convenient and useful form, and (3) to contact other groups and organizations compiling similar information for their comments and cooperation. A pilot project was established as a first step to guide the determination of the format and scope of documentation for available water resources computer programs. A proposed questionnaire given in an appendix comprises a series of data-coding entries of documentation of computer programs (Humphreys-ISWS)

Atlas Series 7, 1975. 56 p, 52 fig, 101 ref, 54 photo. HUD Grant P-1020, P-1042.

Descriptors: *Maps, *Environment, *Alabama, *Natural resources, *Regional development, Geology, *Data collections, Channels, Water resources, Energy, Mineralogy, Topography, Transportation, Climatology, Population, Surface waters, Groundwater, Planning, Economics.
Identifiers: Tennessee-Tombigbee Waterway.

The environmental data necessary to plan for development brought on by the construction of the Tennessee-Tombigbee Waterway were presented. The study area includes all of Sumter County and those parts of Greene and Pickens Counties adjacent to the Tombigbee River. Land use is not limited to crops, pasture, forest, and related industries. Substantial supplies of surface water and groundwater are available and should encourage economic development. Sand and gravel are available for construction; abundant chalk and clay are available for use as lighweight aggregate. Energy sources in this area have not been fully developed. A coal-fired stream plant provides electricity to surrounding areas and a narrow band of lignite that has not been developed occurs in Sumter County. This area has the potential to become more productive; therefore, information was provided on the area's positive characteristics and its limiting factors were enumerated so that development will be accomplished in an orderly and efficient manner. (Scott-ISWS)

**FORMATION FACTORS AND THEIR USE I ESTIMATING WATER QUALITY IN MISSI SIPPI AQUIFERS,**
Geological Survey, Jackson, Miss.
R. Newcome, Jr.
Available from the National Technical Inform tion Service, Springfield, Va 22161 as PB-24 801/AS, $3.25 in paper copy, $2.25 in microfich Water-Resources Investigations 2-75, May 1975. sheet, 6 ref.

Descriptors: *Aquifer characteristics, *Wat quality, *Electrical well logging, Well data, Missi sippi, Electrical resistance, Geology, Boreho geophysics, Sites, Hydrogeology, Forecastin Correlation analysis, Sampling, Geologic form tions, Planning, Water supply, Water type Hydrologic data, Groundwater.
Identifiers: Water-bearing unit, Formation factor

Electric logs constitute one of the most useful da sources in groundwater hydrology. More than 1 calculations of the electrical resistivity formatio factor have been made for sand bed aquifers Mississippi. This 1-sheet atlas shows the locatio of wells at which electric logs and water sampl were used to determine the factors. Because th factors do not all have the same degree of reliabil ty, they are differentiated in three columns of table. Formation factors are presented by wate bearing unit in the table to permit averaging values for a unit and comparison with those other units. The average of all formation factor determined is 3.6 and the median value is 3. There is however, as much range in the values fo a given water-bearing unit as there is among th units. This indicates that in calculation of wat quality the overall average value (3.6) may be valid in many situations as the average determine for the specific water-bearing unit. Differences formation factor appear to be related to water typ and to porosity, cementation, and hydraulic co ductivity of the sand. (Woodard-USGS)

Geological Survey, Harrisburg, Pa.
H. N. Flippo, Jr.
Pennsylvania Department of Environmental Resources, Harrisburg, Water Resources Bulletin No 11, March 1975. 95 p, 13 fig, 1 tab, 17 ref.

Descriptors: *Water temperature, *Surface waters, *Pennsylvania, Streams, Reservoirs, *Data collections, Natural streams, Thermal water, Electric powerplants, Forecasting, Graphical analysis, Curves.

A summary of water-temperature records includes data collected in water years 1944-70 at 72 stream sites in Pennsylvania. Except for some sites with long-term daily records, sites were chosen primarily to portray natural stream-temperature characteristics throughout the Commonwealth. Water temperatures are summarized by months, years, and for the period of record. Average maximum temperature and monthly cumulative-frequency distributions are presented for the daily records. Approximations of daily mean temperature with 1- and 99-percent probabilities of exceedance can be derived from the frequency distributions of daily temperatures at long-term, data-collection sites. Increases in stream temperatures caused by heated wastewater discharges from industry are usually not more than a few degrees Fahrenheit at distances of more than half a mile below the site of entry. Reservoir level manipulations and powerplant operations often cause much greater alterations to stream temperatures, which persist for many miles. In the Allegheny and Ohio Rivers, the average maximum increase in water temperature due to man's activities is about 4 deg F in a 206-mile reach. (Woodard-USGS)

**GROUND-WATER DATA FOR ORANGE COUNTY AND VICINITY, TEXAS AND LOUISIANA, 1971-74,**
Geological Survey, Houston, Tex.
C. W. Bonnet.
Open-file report, 1975. 25 p, 3 fig, 3 tab, 5 ref.

Descriptors: *Groundwater resources, *Observation wells, *Water levels, *Water quality, *Texas, *Louisiana, Water utilization, Withdrawal, Groundwater, Chemical analysis, Well data, Hydrologic data.
Identifiers: *Groundwater data.

A network of 116 observation wells was maintained for water-level measurements from 1971 to 1974. The area within the network includes Orange County, the southern parts of Jasper and Newton Counties, the eastern part of Jefferson County, the southeastern part of Hardin County, all in Texas; and the western parts of Cameron and Calcasieu Parishes, Louisiana. The heaviest concentration of observation wells is within the industrial area in the southern part of Orange County. A network of 76 wells to observe changes in chemical quality of the groundwater was maintained in Orange County. Data on groundwater pumpage for all major uses during the period 1963-74 also are tabulated. These data are essential to the cause and effect relationships between pumping and the decline in water levels or changes in chemical quality. (Woodard-USGS)

**WATER-RESOURCES DATA FOR SKAGWAY, ALASKA,**
Geological Survey, Anchorage, Alaska.
G. O. Balding.
Open-file report, 1975. 34 p, 9 fig, 5 tab, 21 ref, 2 append.

Descriptors: *Groundwater, *Water supply, *Water quality, *Alaska, Aquifer characteristics, Hydrologic data, Wells, Sampling, Water yield, Chemical analysis, Groundwater resources, *Data collections.
Identifiers: *Skagway(Alas), Public water supply.

In 1966 an investigation of the alluvial aquifer at Skagway, Alaska, by the U.S. Geological Survey indicated that groundwater of good quality was available at relatively shallow depth. Two production wells were constructed for the town at that time and recently a third well was completed. Water from these wells is a calcium bicarbonate type of excellent chemical quality. The public water supply of Skagway originally was obtained from the hydroelectric catchment system. Water for homes not serviced by this system was obtained from private wells. Water from the hydroelectric storage system is no longer used for drinking water; however, a supply is maintained in the storage tanks for emergency standby and fire protection. Use of private wells within the town limits of Skagway has also been discontinued. This report is a compilation of past and present data concerning the source, availability, and quality of the water that the community has used, has considered using, and is presently using for its domestic supply. **ARCTIC BARRIER FORMATION,**
Exxon Production Research Co., Houston, Tex. (assignee)
D. E. Galloway.
US Patent No 3,881,318, 3 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 934, No 1, p 56, May 6, 1975.

Descriptors: *Patents, *Barriers, Engineering structures, *Breakwaters, *Offshore platforms, Shore protection, Arctic, Sea ice, Ice loads, *Barrier islands.
Identifiers: *Artificial islands(Barriers).

A method and apparatus is described for the construction of multiple artificial islands (barriers) used to prevent the encroachment of pressure ridges, ice islands and sea ice upon offshore structures, marine pipelines or other marine facilities, in regions such as arctic regions, where bodies of water are subject to freezing. Each island structure is anchored to the sea floor by piles and/or the gravity of the structure and spaced from another island a predetermined distance ranging along the seaward side of the facilities to be protected. The predetermined distance between the individual island structures depends upon the design of the facilities that are to be protected and a risk evaluation. The shorter the spacing between individual island structures the sooner the effects of grounding will occur for ice formations that move into the region in the colder seasons. (Sinha-OEIS)

**TIDE ENERGY CONVERSION DEVICE,**
E. Schmeller.
US Patent No 3,882,320, 3 p, 7 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 934, No 1, p 361, May 6, 1975.

Descriptors: *Patents, *Tidal powerplants, *Tidal energy, Tidal water, Electric power, Equipment.
Identifiers: Tidal energy conversion.

A tide energy conversion device includes a plurality of spaced apart pairs of parallel endless channel members elongated in the direction of tide flow and facing each other. The members include lower flights that are substantially horizontal and straight. Roller frames, each having two pair of spaced apart rollers, one pair in each channel of a pair of channels, carry elongated blades extending outward and transverse of the channels. These blades are connected to the frames by brace arms, each extending diagonally from the frame to locations adjacent the outer edge of a blade, and by support arms, each connected to an edge of a blade. The channel members are supported on base which is secured at a level that supports t blades so they are at least partially submerged the water while they are carried beneath the cha nels. Endless chains connect the several roll frames. The chains extend over longitudinall spaced sprockets rotated on shafts. Force of t tide flow against the movable blades rotates t shafts which are connected to electrical gener tors. Gear reduction and transmission means provided to enable the generators to produce ele tricity regardless of the directional movement the blades. (Sinha-OEIS)

**MAINTENANCE OF THE FEDERAL NAVIG TION PROJECT IN SCARBORO RIVER A SCARBORO, MAINE (FINAL ENVIRONME TAL IMPACT STATEMENT).**
Corps of Engineers, Waltham, Mass. New E gland Div.
Available from the National Technical Inform tion Service, Springfield, Va. 22161, USDC, EIS-ME-74-0004-F, $4.25 in paper copy, $2.25 microfiche. January 2, 1974. 66 p, 1 tab, 1 map, append.

Descriptors: *Maintenance, recreatio *Navigable rivers, Sands, Rivers, Channels, Fis *Maine, Fishing, Recreation facilities, Enviro mental effects, Marine biology, Disposa Dredging.
Identifiers: *Environmental Impact Statement *Scarboro River(Maine).

The proposed action involves the continued mai tenance of the federal navigation project in Sca boro River, Scarboro, Maine. Primary mai tenance activities will consist of removal of san from the river and outer channel. Restoration the navigational channel and anchorage to the authorized depths will benefit commercial fishe men, recreational boaters, and others who depen on safe and adequate navigation facilities. No pe durable adverse environmental effects to th marine ecology of the immediate project area a anticipated. Alternatives are complete, partial, no maintenance by offshore disposal with buck dredge, onshore disposal with hydrolic dredge, sidecast dredge. (Gagliardi-Florida)
W75-09811

**INITIAL STAGE, OAHE UNIT, PICK-SLOA MISSOURI BASIN PROGRAM, SOUT DAKOTA (FINAL ENVIRONMENTAL IMPAC STATEMENT).**
Bureau of Reclamation, Washington, D.C.
Available from the National Technical Informa tion Service, Springfield, Va. 22161, USDC, a EIS-SD-73-1953-F, $12.00 in paper copy, $2.25 i microfiche. December 17, 1973. 496 p, 53 fig, 2 tab.

Descriptors: *South Dakota, *Missouri River *Irrigation systems, Flood control, Wildlife con servation, Habitat improvement, Recreation Recreation facilities, Pumping plants, Irrigatio canals, Multiple-purpose reservoirs, Drains Water quality control, Water supply development Irrigation programs, Wetlands, Wildlife habitats Drainage effects, Fresh-water marshes, Stream flow, River flow, Community development.
Identifiers: *Environmental Impact Statements *Lake Oahe(SD).

The Oahe unit will divert water from Lake Oahe t the Missouri River for irrigation of 190,000 acre of land. The project will provide for some flood control, water for municipal use in 17 towns and

ties, fish and wildlife developments at 18 locaons and for recreation development at 5 locaons. Construction will include an Oahe Pumping lant, 200 miles of main supply canals, three regu-ting reservoirs, 1,000 miles of small canals, 935 iles of open drains and 2970 miles of closed ains. The project will enhance farming, create a tter quality water supply for municipalities, and crease the number of recreational facilities. One creational facility will have to be relocated and er 20,000 acres of wetlands will be altered mewhat. The project will have an overall benefi-l impact on waterfowl and wildlife by creating w marsh areas, new habitats, and a more stable ter supply. Alternatives considered were no velopment and alternative locations of main pply works or construction of floodways along e James River, and precipitation management. ltuve-Florida)

scriptors: *Watershed management, oodwater, *Flood protection, Erosion, Sedi-nts, Flood plains, Agriculture, Recreation, ter storage, Fish, Lakes, *Kentucky, Sewage tment, Sewage, Environmental effects, Wil-e, Forestry, Floodproofing, Flood plain zon-Flood plain insurance, Flood forecasting.
ntifiers: *Environmental Impact Statements, rue County(Ky).

project involves construction of a 34,610 acre ershed in Larue County, Kentucky, and also udes land treatment measures, two single-pur-e structures and two multiple-purpose struc-s for floodwater, recreation and municipal er storage. The project will result in a reduc-of erosion rates on uplands and a reduction of dwater and sediment damages. In addition, the ect provides for a 100-year level of flood pro-on to existing flood plain properties including age treatment plants and elimination of raw age overflow. Adverse environmental effects de the permanent loss of approximately 294 s of terrestrial wildlife habitat; the temporary of an additional 70 such acres; increasing sedi-during construction; modification of the gical make-up of approximately 12,400 feet tream; and the interruption of agricultural, try and wildlife use on 476 acres. The follow-lternatives were considered: land treatment, proofing, flood plain zoning, flood insurance flood forecasting; or no action. (Gagliardi-da)

**HOOK BEACH EROSION CONTROL, T ANGELES, WASHINGTON (FINAL EN-ONMENTAL IMPACT STATEMENT).**
Engineer District, Seattle, Wash.
able from the National Technical Informa-Service, Springfield, Va. 22161, USDC, as, WA-73-0821-F., $4.25 in paper copy, $2.25 in fiche. August 1972. 60 p, 1 map.

riptors: *Washington, *Rocks, *Beaches, establishment, Boats, Basins, Fish, En-mental effects, Seashores, Quarries, Fish stocking, Sea walls, Washington, Recreation, Fish populations, Fish management, Breakwaters, Groins(Structures), Road construction, Roads.
Identifiers: *Environmental Impact Statements, *Ediz Hook(Wash), *Port Angeles(Wash).

The project involves new rock revetment and beach nourishment of about 10,000 feet of the seaward shore of Ediz Hook, Washington. Material for the revetment would come from existing quarries in the Puget Sound area. Beach nourishment material would come from a source near Port Angeles. The proposed project would provide protection for Port Angeles Harbor, a small boat basin, and access to a Coast Guard Station, and a day-use recreation area. New habitat for rockfish and bottom fish would be created. The primary adverse environmental effect of the project is that the natural appearance of the project area and borrow sites would be altered. Additionally, increased rockfish populations could displace or reduce other fishery resources. The following alternatives were considered: concrete seawalls; off-shore breakwaters; porous walled breakwaters; groin fields; elevated roadways; beach nourishment; removal of man-made structures which impede the natural supply of feed material to Ediz Hook; industrial fill; and no action. (Gagliardi-Florida)

**PROPOSED NAVIGATIONAL MAINTENANCE DREDGING PROJECT AT GUILFORD HARBOR, GUILFORD, CONNECTICUT (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Corps of Engineers, Waltham, Mass. New England Div.
Available from the National Technical Information Service, Springfield, Va. 22161, USDC, as, EIS-CT-73-1860-F, $4.25 in paper copy, $2.25 in microfiche. November 28, 1973. 68 p, 3 map, 2 tab.

Descriptors: *Boating, *Recreation, *Dredging, *Shoals, Water quality, Plankton, Harbors, Navigation, *Connecticut, Environmental effects, Boats.
Identifiers: *Environmental Impact Statement, *Guilford Harbor(Conn).

The proposed action involves the maintenance dredging of the Federal navigation project in Guilford Harbor, Connecticut. The project's authorized dimensions will be maintained, thus enabling safe passage and mooring of recreational boats in the harbor. The chief environmental impact of the project will be the dredging and disposal of approximately 70,000 cubic yards of shoal material at the offshore New Haven dump site. Adverse environmental effects include destruction of marine organisms in the dredged spoil areas; temporary degradation of water quality during the work period; and possible detrimental effects of heavy metals leached from the spoil material on the developing eggs and larvae of the plankton in the harbor and on the benthic life at the spoil site. Boating activity and beach recreation might be temporarily interfered with during the work period. Two alternative methods of dredging were considered--hydraulic and bucket dredging. (Gagliardi-Florida)
W75-09821

**UPPER MULBERRY RIVER WATERSHED, BARROW, GWINNETT, HALL, AND JACKSON COUNTIES, GEORGIA (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Soil Conservation Service, Washington, D.C.
Available from National Technical Information Service, Springfield, Va 22161, USDC, as EIS-GA-74-0005-F, $4.25 in paper copy, $2.25 in microfiche. January 2, 1974. 57 p, 2 chart, 1 tab.

Descriptors: *Watershed management, *Flood protection, *Water storage, Fishing, Economics, Floodwater, Streams, Channels, Flood control, Streamflow, *Georgia, Agriculture, Environmental effects, Forests, Forestry, Wildlife, Fish, Water quality, Turbidity, Channeling, Flood plains, Flood plain zoning.
Identifiers: *Environmental Impact Statements.

The project involves land treatment conservation and construction of seven single-purpose floodwater retarding structures, two multiple-purpose structures, approximately 8,750 feet of selective debris removal from stream channels, approximately 85,675 feet of stream bank protection, and 241 acres of road bank stabilization in Barrow, Gwinnett, Hall and Jackson Counties, Georgia. Favorable environmental impacts include watershed protection, flood prevention, stream bank stabilization, conservation treatment of agricultural and forest land, municipal water storage, increased fishing opportunities, and economic improvement. Adverse environmental effects of the project consist of loss of habitat for wildlife, decreased habitat values in flood storage pools, inundation of stream segments, temporary damage to game and fish habitat from debris removal, and temporary degradation of water quality due to increased turbidity levels during construction and until disturbed streambanks become stabilized. The following alternatives were considered: conservation land treatment alone; conservation land treatment, floodwater retarding structures, and channel enlargement; conservation land treatment and floodwater retarding structures; conservation land treatment and channel improvement; and purchase of flood plain or zoning. (Gagliardi-Florida)
W75-09822

**CRUDE OIL AND NATURAL GAS PRODUCTION AND OTHER MINING OPERATIONS IN NAVIGABLE WATERS ALONG THE LOUISIANA COAST (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Army Engineer District, New Orleans, La.
For primary bibliographic entry see Field 5G.
W75-09823

**PROPOSED MAINTENANCE DREDGING OF THE CHANNEL FROM U.S. COAST GUARD SANTA ROSA STATION MOORINGS TO NAVIGABLE WATERSHED IN PENSACOLA BAY (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Coast Guard District (8th), New Orleans, La.
Available from National Technical Information Service, Springfield, Va 22161, USDC, as EIS-FL-73-2010-F, $3.25 in paper copy, $2.25 in microfiche. December 26, 1973. 23 p, 3 fig.

Descriptors: *Dredging, *Channel improvement, *Environmental effects, Channel morphology, Channels, Navigable waters, *Florida, Beaches, Beach erosion, Turbidity, Levees, Benthic fauna, Benthic flora.
Identifiers: *Environmental Impact Statements, *Pensacola Bay(Fla).

The proposed project provides for maintenance dredging of the channel from the moorings at the U.S. Coast Guard Station, Santa Rosa, to navigable waters in Pensacola Bay, Florida. Redredging of the channel will ensure safe operation of Coast Guard boats to carry out search and rescue missions, pollution surveillance and enforcement operations. Disposal of the spoil behind retaining levees along the beach will restore the shoreline to a condition approaching its original state. Dredging will cause temporary turbidity near the operation, but will have very little other adverse effect. Some

benthic organisms will be destroyed, but refaunation will occur. Practical engineering alternatives to the proposed dredging do not exist. The Santa Rosa Regional Planning Council commented to the effect that the operation will cause the destruction of productive marine grass beds. (Denvir-Florida)
W75-09824

**PREVENTION AND MITIGATION OF SHORE DAMAGES, KAHULUI HARBOR, MAUI, HAWAII (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Corps of Engineers, Honolulu, Hawaii. Pacific Ocean Div.
Available from National Technical Information Service, Springfield, Va 22161, USDC, as EIS-HI-73-1862-F, $3.75 in paper copy, $2.25 in microfiche. November 28, 1973. 42 p, 3 map.

Descriptors: *Shore protection, *Beach erosion, *Groins(Structure), *Breakwaters, Construction, Construction materials, Shores, Beaches, Hawaii, Sands, Turbidity, Marine fish, Recreation.
Identifiers: *Environmental Impact Statements, *Kahului Harbor, Maui, HI.

The proposed plan for shoreline protection, and beach restoration at Kahului Harbor, Maui, consists of the construction of about 760 feet of revetment along Kahului Beach Road, the placement of about 11,000 cubic yards of sand along the southern shoreline of Kahului Harbor, and construction of one groin extension, two new groins, and one breakwater to protect the sand placements. Construction activities will create some turbidity in the water and disturb fish and marine life to some extent as well as interfere with recreational use. The revetment will prevent continued erosion of the western shoreline and allow safe use of Kahului Beach Road. The sand placement and protective structures will create additional beach which will result in greater recreational use along the southern shore. Alternatives considered were utilization of portions of the plan in combination or singly, or no action. (Denvir-Florida)
W75-09825

**ATCHISON, TOPEKA AND SANTA FE RY. CO. V. CALLAWAY (ACTION BY RAILROAD, ENVIRONMENTALISTS AND OTHERS TO HALT RECONSTRUCTION OF LOCK AND DAM ON UPPER MISSISSIPPI RIVER NAVIGATION SYSTEM BY DEFENDANT CORPS OF ENGINEERS).**
382 F. Supp. 610-624 (DDC 1974).

Descriptors: *Locks, *Dams, *Mississippi River, *Illinois, Rivers, Navigable rivers, Railroads, Environment, Environmental effects, Environmental control, Navigable waters, Navigation, Rivers and Harbors Act, Water.
Identifiers: *Environmental Impact Statements, Injunctive relief.

The Santa Fe Railway Company and environmentalists brought suit to halt the reconstruction of locks and a dam on the Upper Mississippi River Navigation System, located at Alton, Illinois. On plaintiff's motion for a preliminary injunction, the District Court for the District of Columbia held that, in view of the increased tonnage which the lock would handle and the likelihood that the project was merely the beginning of a complete overhaul of the entire system, the construction required congressional approval. The court found that the Rivers and Harbors Act of 1970 applied to the proposed reconstruction, and that when a federal statute has been violated, the court is not obliged to inquire into traditional requirements for equitable relief before granting an injunction. Because congressional approval had not been given, and the environmental impact statement failed to sufficiently consider the possible environmental effects of the reconstruction of the entire system of locks and dams, the Corps of Engineers was enjoined from taking bids for the proposed reconstruction. Identifiers: *Trickle irrigation, *Drip irrigation.

Polythylene pipes with 1/2 inch diameter and 1/16 inch size perforations have been used to study the hydraulics of flow, under laboratory conditions. The variables considered for study were (i) length of the pipe (ii) spacing of perforations (iii) pipe slope (iv) placement of perforations (facing upward, downward and sidewise) and (v) operating pressure (up to 5 ft.). Three repeated readings have been taken for each test and validity of the results showing relationship of discharge with variables considered has been established with suitable tests. Identifiers: *Inertia, *Circular piers, Morison equation, Phase angles, Wave steepness, Impact pressures.

An experimental procedure was developed to determine the values of two hydrodynamic coefficients, i.e., the drag and inertia coefficients, which are required for the determination of wave forces on circular piers by the Morison equation. By adopting this procedure, the coefficients can be plotted as a function of wave phase angle and wave steepness. (Lee-ISWS)

ri Univ., Columbia. Dept. of Agricultural ering.
Misra, and R. P. Beasley.
ctions of the American Society of Agricul- ngineers, Vol 18, No 2, p 260-262, March- 975. 7 fig, 2 tab, 2 ref.

tors: *Drains, *Drainage systems, *Excess Soils), *Hydraulic models, Drainage prac- ipes, Storm drains, Drainage water, Tiles, Conduits, Subsurface drains, Drainage, Sediment transport, Soils, Movement, Sediments.
Identifiers: *Plastic drain tubing, *Corrugated drain tubing, Soil tanks.

Model studies were made to investigate the effect of high water velocity on the extent of soil movement when corrugated plastic drain tubing is used as conduits for underground terrace outlets on steep slopes. No significant amount of sediment was drawn into the tubing, even when the slope was 10% and velocity approached 9 ft per sec. The magnitude of the flow from the tubing to the soil was low in cohesive soils. But, with less cohesive soils this outflow was greater and there was considerable movement of soil from around the tubing. (Sanderson-ISWS)

**ON THE DISCHARGE COEFFICIENT OF NOZZLES FOR SINGLE- AND TWO-PHASE FLUIDS,**
Urals Polytechnic Inst., Sverdlovsk (USSR). Hydraulics Div.
V. A. Doroshenko.
Fluid Mechanics - Soviet Research, Vol 3, No 6, p 52-56, November-December 1974. 4 fig, 13 ref.

Descriptors: *Discharge coefficient, *Nozzles, *Laboratory tests, Pipes, Flow, Flow rates, Measurement, Hydraulics, Testing.
Identifiers: *Two-phase flow, Gas-liquid mixture, Water-air mixture.

Experimental data were obtained for the discharge coefficient of standardized nozzles with water and air-water mixtures with volumetric gas concentrations from 10 to 40%. A marked difference was found between experimental data and values recommended by the 1964 Soviet regulations, particularly in the range of low Reynolds numbers and small nozzle modulus (discharge cross section). Additional investigations are needed for working out final recommendations. Standardized nozzles can also be used for determining the volumetric flow rates of gas-liquid mixtures because the data for the flow rate of mixtures with any gas content and pressure drop across the nozzle fit on parabolic curves. (Humphreys-ISWS)

Descriptors: *Water hammer, *Theoretical analysis, *Hydrodynamics, Analytical techniques, Mathematical studies, Equations, *Pipe flow, Pressure, Velocity, Pipes, Continuity equation, Waves(Water).

A case was considered of inception of wave processes in a pipe resulting from changing the pressure at one of its ends and connecting a hydraulic tank at the other. The problem was considered by taking into account the liquid viscosity. By solving differential equations of continuity and motion, general expressions were obtained for the pressure and velocity of the liquid. These expressions can be used to calculate the pressures and velocities in any sections of the pipeline at any time. (Humphreys-ISWS)

**FRICTION FACTOR UNDER OSCILLATORY WAVES,**
Queen's Univ., Kingston (Ontario). Dept. of Civil Engineering.
J. W. Kamphuis.
Journal of the Waterways, Harbors and Coastal Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No WW2, Paper 11292, p 135-144, May 1975. 9 fig, 11 ref, 2 append.

Descriptors: *Coastal engineering, *Roughness coefficient, *Shear stress, *Waves(Water), *Laboratory tests, Flow rates, Sediment transport, Boundary layers, Turbulent flow, Laminar flow, Friction.
Identifiers: *Oscillatory waves, Stanton diagrams, Nikuradse sand grain roughness.

Tests were performed in an oscillating water tunnel to determine the relationships between wave parameters and resulting bottom friction and shear stresses. The test results were presented in Stanton-type wave friction factor diagrams and the results were compared with existing semitheoretical expressions. The wave friction factor in the laminar, the smooth, and the rough turbulent regimes was defined. Some caution must be used when applying the postulated friction factor in the transition region. Journal of the Engineering Mechanics Division, Proceedings of American Society of Civil Engineers, Vol 101, No EM1, Paper 11116, p 1-11, February 1975. 2 fig, 9 ref, 2 append.

Descriptors: *Waves(Water), *Statistics, *Piers, *Oceans, *Energy, Profiles, Marinas, Structures, Mechanical engineering.
Identifiers: *Wave forces, *Standard deviations, *Vertical cylinders.

Expressions of the mean and standard deviation of wave force on vertical cylinder in a random field were derived. Wave force was evaluated according to Morison's formula and the sea surface was assumed to be Gaussian. The effects of free surface fluctuation were included. The mean and standard deviation were computed and results were presented graphically. It was shown that the mean of wave force is nonzero. The standard deviation of wave force deviated drastically from that when the free surface fluctuation

phenomenon was ignored, especially in the vicinity of the mean water level. Since most of the water movements are around and above the mean water level where the foregoing observed discrepancy was most pronounced, it was concluded that the effects of the free surface fluctuation phenomenon on wave force has important implications on the design considerations of marine structures that protrude above the mean water level. **CHAMBER METHOD FOR DRIP IRRIGATION SYSTEM DESIGN AND INSTALLATION PROCEDURE,**
Massachusetts Univ., Amherst.
E. S. Pira.
In: Proceedings of the Second International Drip Irrigation Congress, p 121-126, (1974). 4 fig, 2 tab, 2 ref.

Descriptors: *Head loss, *Design criteria, *Irrigation design, Irrigation methods, Flow rates, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

High pressure water is supplied through a 'quick-fill' and pressure reducing device to a low pressure chamber. A minimal pressure drop in the chamber produced a relatively uniform discharge rate from the drippers. Practical field installations based on laboratory tests, field tests and simulation model are discussed. System design criteria, components, materials, detailed illustrations and installation procedures are presented. (See also W75-09423) (Skogerboe-Colorado State)

**REVERSE FLUSHING TECHNIQUE FOR BI-WALL DRIP TUBING,**
Agricultural Research Service, Riverside, Calif. Salinity Lab.
S. L. Rawlins.
In: Proceedings of the Second International Drip Irrigation Congress, p 209-211, (1974). 2 fig.

Descriptors: *Clogging, Irrigation, Agriculture, Irrigation systems.
Identifiers: *Trickle irrigation, *Drip irrigation, *Bi-wall tubing, *Reverse flushing.

Particles carried in the irrigation water first lodge in the inside orifices between the supply and emission chambers of biwall drip tubing. These can be effectively dislodged by briefly applying water at high pressure to the emission chamber. They can then be flushed from the supply chamber in the usual manner. Because the burst pressure of tubing varies inversely with its diameter, the small emission chamber can withstand considerably higher pressures than can the supply chamber. Results of tests using this technique are discussed. (See also W75-09423) (Skogerboe-Colorado State)

**TRICKLE IRRIGATION IN MICHIGAN ORCHARDS: CONTROLLING RATE OF FLOW WITH FLOW REGULATING VALVES AND MICROTUBES,**
Michigan State Univ. Lansing.
A. L. Kenworthy, and C. Kesner.
In: Proceedings of the Second International Drip Irrigation Congress, p 275-280, (1974). 3 fig, 2 tab, 2 ref.

Descriptors: *Flow rates, *Michigan, Irrigation systems, Orchards, Irrigation, Agriculture, Valves, Control.
Identifiers: *Trickle irrigation, *Drip irrigation, *Microtubes, *Flow regulating valves, Flow regulation.

An appropriate combination of flow regulating valves and microtubes of different inside diameter has been found ideal for studying rates of flow in trickle irrigation. The flow regulating valve is installed in a row lateral. Capacity of the valve is selected to provide the amount of water desired for the row. To distribute the water and counter elevation changes, microtubes of different inside diameters are used and thus avoid excessive microtube lengths. Selection of an appropriate microtube ID in accordance to flow rate will permit a uniform value to adjust microtube length according to elevation change. Data on uniformity of water distribution is presented. (See also W75-09423) (Skogerboe-Colorado State)
W75-09467

**HYDRAULICS OF SINGLE-CHAMBER VS. DUAL-CHAMBER TUBING,**
Hawaiian Agronomics, Inc., Honolulu.
C. M. Vaziri.
In: Proceedings of the Second International Drip Irrigation Congress, p 293-298, (1974). 2 tab.

Descriptors: *Hydraulic design, Hydraulic properties, Hydraulics, *Irrigation design, Irrigation system, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

The basic hydraulic relationship of pressure, orifice diameter, coefficient of discharge, and the friction loss along a tube is a necessity before one can design an adequate drip or subsurface irrigation system. There are several types of tubing and emitters available. But the most unique difference hydraulically is the single chamber tubing versus a dual chamber tubing. The single chamber tube is found to provide an acceptable range of orifice flow uniformity from the head of tubing to the end for approximately 300' of length. Beyond this reach the friction loss in the 1/2' polyethylene tubing is excessive and causes a reduction in the orifice flow rate. The flow rate through each plastic orifice is proportional to the square root of the pressure inside the tubing at the orifice point. The other type of tubing that has been experimented with is dual chamber tubing. One chamber is for the conveyance. This in turn is connected to the outside chamber (the distribution tube) and water is emitted to the outside through desired orifice spacing, depending on soil types and plantings. Equations are developed to describe the flow pattern for dual chamber tubing and the relationship between the inner and outer chamber. The effect of orifice diameters and orifice spacing on the outer chamber pressure is discussed. (See also W75-09423) (Skogerboe-Colorado State)

**DESIGN CHARTS FOR DRIP IRRIGATION SYSTEMS,**
Hawaii Univ., Honolulu.
I. P. Wu, and H. M. Gitlin.
In: Proceedings of the Second International Drip Irrigation Congress, p 305-310, (1974). 3 fig, 4 ref.

Descriptors: *Irrigation design, *Design flow, *Design criteria, *Hydraulic design, Hydraulics, Irrigation systems, Irrigation, Agriculture, Design.
Identifiers: *Trickle irrigation, *Drip irrigation.

A simple design procedure has been developed for drip irrigation systems installed on either uniform or non-uniform slopes. The charts presented can be used to design a system with an allowable discharge (emitter) variation up to 20%. A dimensionless energy gradient curve has been developed theoretically for drip irrigation lines, submain and lateral, and was checked by laboratory and field experiments. It was found that a typical dimensionless energy gradient curve which was developed by using turbulent flow in smooth pipe can be used for flow conditions having 20% discharge (emitter) variation and percentage of laminar flow up to 30%. The dimensionless energy gradient curve combined with different slope conditions will show the pressure variation along the drip irrigation line. Design charts have been developed for both single tubing and twin-chamber drip irrigation systems. Examples are presented showing the design procedure. (See also W75-09423) (Skogerboe-Colorado State)

**DESIGN CRITERIA FOR MECHANICAL, ELECTRIC, AND FLUID SYSTEM AND COMPONENT RELIABILITY, SUPPLEMENT TO FEDERAL GUIDELINES FOR DESIGN, OPERATION, AND MAINTENANCE OF WASTE WATER TREATMENT FACILITIES.**
Environmental Protection Agency, Washington D.C. Office of Water Program Operations.
For sale by the Superintendent of Documents U.S. Government Printing Office, Washington, D. C. 20402, Price $0.85. Technical Bulletin EPA-430-99-74-001, (1974). 54 p.

Descriptors: *Design criteria, *Municipal wastes, Discharges, Navigable waters, Federal jurisdiction, Guidelines, Legislation, Potable water, Effluents, Hydraulic capacity, Pipes, Maintenance, *Treatment facilities, *Waste water treatment.
Identifiers: Mechanical systems, Electrical system, Fluid systems.

As a supplement to the federal guidelines on design, operation, and maintenance of waste water treatment facilities, this document details design criteria for municipal waste water treatment works. Minimum standards are given for reliability for mechanical, electric, and fluid systems and components. These criteria are necessary for

sign of waste water treatment facilities seeking
ederal financial assistance under PL 92-500.
efinitions of such terms as component, con-
olled diversion, design flow, effluent limitation,
draulic capacity, navigable waters, and reliabili-
are given. Three classes of treatment works are
rks which discharge into navigable waters that
uld be permanently or unacceptably damaged by
luent in only a few hours (near reservoirs for
table water or areas of shellfish); those which
charge into navigable waters which migh be
maged by continued (over several days) effluent
ality degradation (such as recreational waters);
l works not included in the previous two.
sign criteria are detailed, regarding: works loca-
ns; provisions for expansion or upgrading; pip-
requirements; pipes subject to clogging; pipe
ining provisions; feed line maintenance and
air; component access space, repair, and han-
g; and essential services. Systems design
eria are enumerated, and include the electric
ver system, instrumentation, and sludge han-
g systems. (Prague-FIRL)

**TABLE ROCK LAKE, WHITE RIVER, MISSOURI (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Army Engineer District, Little Rock, Ark.
Available from the National Technical Information Service, Springfield, Va. 22161, USDC, as, EIS-MO-73-1469-F, $4.25 in paper copy, $2.25 in microfiche. September 7, 1973. 54 p, 1 map.

Descriptors: *Hydroelectric power, *Hydroelectric plants, *Flood control, Fish genetics, Vegetation, *Arkansas, Lakes, Powerplants, Parks, Land resources, Water resources, Water resources development, Pollutants, Thermal pollution, Air pollution, Environmental effects.
Identifiers: *Environmental Impact Statements, *Table Rock Lake(Ark).

The proposed operation and maintenance of Table Rock Lake, Arkansas includes hydroelectric power generation, flood control, operation and maintenance of parks, and management of land and water resources. The needed electrical energy is produced without air or thermal pollution, but creates a downstream environment dependent upon cold water releases. Accompanying lake fluctuations change the environment along the shoreline with respect to fish spawning and vegetation survival. These lake fluctuations that adversely affect vegetation along the shoreline and fish in the lake are the primary adverse environmental effects of the project. The alternatives to the present activities would be modification or total cessation of hydroelectric power generation, flood control, and different management practices. (Gagliardi-Florida)

**CHARLES RIVER DAM, BOSTON, MASS (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Corps of Engineers, Waltham, Mass. New England Div.
Available from the National Technical Information Service, Springfield, Va. 22161, USDC, as, EIS-MA-73-1612-F, $5.75 in paper copy, $2.25 in microfiche. October 11, 1973. 127 p, 3 fig, 2 tab.

Descriptors: *Dams, *Earth dams, *Concrete dams, *Locks, *Fish ladders, Recreaction, Flood protection, Fish, *Massachusetts, Aesthetics, Flood control, Rivers, Pumping, Pumping plants, Navigation, Flood damage, Boats, Water quality, Diversion, Fish passages, Environmental effects, Disposal, Reservoir storage, Dikes.
Identifiers: *Environmental Impact Statement, *Charles River(Mass).

The proposed action entails construction of a multiple-purpose earth and concrete dam with river pumping facilities, three navigation locks, and a fish ladder on the Charles River, Massachusetts. The project will enhance the aesthetic and recreational potential of the area, provide a flood-free environment, eliminate extensive flood losses, improve movement of boat traffic, enhance water quality in the Charles River Basin, and improve fish passage. The adverse environmental effects of the action will consist of temporary inconvenience during construction and offshore disposal of polluted material removed for site preparation. The following alternatives were considered: upstream reservoir storage, perimeter diking, diversion, improved pumping vailities, improved locking facilities in the existing dam, or no action. (Gagliardi-Florida)
W75-09816

**BUSHLEY BAYOU, LOUISANA (FINAL ENVIRONMENTAL IMPACT STATEMENT).**
Army Engineer District, Vicksburg, Miss.
Available from the National Technical Information Service, Springfield, Va. 22161, USDC, as, EIS-LA-73-1528-F, $4.75 in paper copy, $2.25 in microfiche. September 20, 1973. 88 p, 6 map.

Descriptors: *Flood protection, *Levees, *Floodgates, *Canals, Wildlife management, Water supply, Water control, Backwater, Flooding, Floods, Flood control, Louisiana, Drainage, Pumping plants, Pumping, Pumps, Wildlife, Wildlife habitats, Fish, Headwaters, Drainage, Environmental effects, Forests, Hardwood, Archaeology, Streams, Flood forecasting, Flood plains.
Identifiers: *Environmental Impact Statements, *Bushley Bayou(LA).

The project is designed to determine the advisibility of providing backwater flood protection to the Bushley Bayou, Louisiana, area by means of a loop levee, gravity floodgate, internal drainage canal, and a 1,500 cubic-foot-per-second pumping station. The acquisition of 3,000 acres of suitable wildlife land, water supply and control facilities was recommended as a measure to mitigate project-induced fish and wildlife losses. The proposed action will make feasible headwater flood protection and more efficient drainage of the protected area. Adverse environmental effects of the project include the loss of 5,900 acres of bottomland hardwood forest, the reduction in extent and quality of fish and wildlife habitat, and possible damage to Indian mounds of archaeological value. Levee alignment with the floodway to intercept hill stream headwater flood flows; a levee and floodgate without pumping plant; a flood forecasting and warning system; flood plain regulation; permanent evacuation of the flood plain were considered alternatives. (Gagliardi-Florida)

DRAINAGE MATERIALS.
Food and Agriculture Organization of the United Nations, Rome (Italy). Working Party on Water Resources and Irrigation.
Food and Agriculture Organization of the United Nations, Water Resources and Development Service, Rome, Irrigation and Drainage Paper No 9, 1972. 122 p.

Descriptors: *Drainage, *Drainage engineering, *Tile drainage, *Land reclamation, *Europe, Drainage effects, Drainage practices, Drainage systems, Construction equipment, Dewatering, Lateral conveyance structures, Tiles, Clay pipes, Conduits, Pipes, Plastic pipes, Tile drains, Filters, Soil filters, Screens, Agriculture, Arid lands, Economics.
Identifiers: *Drainage materials, France, The Netherlands, Belgium, Federal Republic of Germany, Hungary, United Kingdom.

This collection of seven essays reviews experiences with drainage materials in The Netherlands, Belgium, France, the Federal Republic of Germany, Hungary, and the United Kingdom. Various types of pipes and filters are considered. Since drainage is a frequent problem in the irrigation districts of arid lands, the papers are pertinent to environments radically different from Western Europe. In the past, drainage materials were manufactured near their place of use. Increasingly, however, such materials are being imported; thus, it is becoming imperative that international standards on pipe sizes, etc., be set to make such equipment compatible. Also, in a world of rising energy prices, information on manual versus mechanical costs in laying out drainage systems has growing pertinence, particularly in the underdeveloped arid regions. (See W75-09629 thru W75-09634) (Bowden-Arizona)

SURVEY OF EXPERIENCE WITH DRAINAGE MATERIALS AND REVIEW OF AVAILABLE SPECIFICATIONS,
Rijksstation voor Landbouwtechniek, Merelbeke (Beligium).
R. Deckx, A. Maton, and W. Dierickx.
In: Food and Agriculture Organization of the United Nations, Rome, Irrigation and Drainage Paper No 9, p 27-34, 1972. append.

Descriptors: *Specifications, Design standards, *Drainage engineering, Europe, *Clay pipes, *Plastic pipes, *Tile drainage, *Land reclamation, Drainage, Pipes, Filters, Soil filters, Construction equipment, Arid lands, Irrigation, Costs, Reviews.
Identifiers: *Drainage materials, *Belgium.

Three drainage materials used in Belgium, but also very applicable in more arid lands where drainage and irrigation practices are directly linked, are discussed. The materials considered (plastic pipes, pipes of baked clay, and enveloping materials) are supplied in Belgium by Germany or the Netherlands. In Belgium smooth plastic pipes were introduced with a glass fiber sheet as enveloping material but never replaced the more traditional baked clay pipes because of occasional inferior quality. Corrugated pipes have aroused much interest of late, and because of their competitive prices, have the chance of replacing clay pipes. Statistical information is provided about pipe measurement, and resistance to compression and shock; some general characteristics of smooth plastic pipes and pipes baked in clay are described. Glass fiber sheet, glass wool and flax band are compared in their effectiveness as enveloping materials. (See also W75-09628) (Bowden-Arizona)

STUDY OF EXPERIENCES WITH DRAINAGE MATERIALS AND A REVIEW OF SPECIFICATIONS AVAILABLE IN FRANCE,
Centre National d'Etudes Techniques et de Recherches Technologiques pour l'Agriculture, les Forets et l'Equipment Rural, Antony (France).
J. Dunglas.
In: Food and Agriculture Organization of the United Nations, Rome, Irrigation and Drainage Paper No 9, p 35-40, 1972.

Descriptors: *Specifications, Design standards, *Drainage, *Drainage engineering, Europe, *Clay pipes, *Land reclamation, *Construction equipment, Pipes, Clay pipes, Plastic pipes, Filters, Intakes, Dewatering, Tile drainage, Arid lands, Irrigation, Economics, Machinery, Reviews.
Identifiers: *France, *Drainage materials.

France has no national specifications on drainage materials because natural conditions are too diverse and the finding of test and experiments in progress are too uncertain. Results of tests made in the laboratory and under field conditions are presented, showing that smooth plastic pipes promote better water flow than corrugated pipes; wider drain slots are advantageous because they diminish intake resistance but dangerous because they accelerate the entry of fine soil particles into the pipe; and the use of filtering material to envelope drain pipes reduces the amount of sediment build-up in the pipes and prevents the washing away of the soil surrounding the pipes. Pipes, field and pipe-laying equipment and drainage plans made are described. Many of the problems and conditions discussed have value not only for terrains similar to those in France, but can also be applied to more arid areas. (See also W75-09628) (Bowden-Arizona)

Identifiers: *Drainage materials, Germany, *Federal Republic of Germany.

Clay and corrugated plastic pipes have replaced fascines, wooden boxes and concrete pipes in western European drainage practices. Detailed information on pipe sizes and costs are presented in table form, and pipe line fittings and filters are also discussed. Techniques for backfilling drainage ditches are given for several different soil types, thus making the information relevant not only to the drainage areas in western Europe but also to the drier areas of the earth where similar techniques are practiced for irrigation and the associated drainage. Terra cotta drainage pipes are widely used in H
gary. Drainage systems failed to expand betw
the two World Wars, and only in recent dec
has the construction of new drainage syst
begun. Drainage work currently being underta
is mainly in regions of brown forest soils of p
do-gley and clay-flush which have been dama
by residuary, stagnant surface waters. In the
of mole drainage, gravel is used as a filte
material. According to Hungarian specificati
the gravel used as filter material should not
tain clay, silt, iron, or ochre fractions. Test res
are given from experiments carried out on var
filtering materials and lime treatment of the dr
trench soil. Drainage of soils with heavy min
contents whould be concurrent with deep loo
ing and mole drainage to improve the water h
dling of the soil and to reduce costs. Th
techniques are valuable not only in areas with
rain similar to that in Hungary, but to more
areas. (See also W75-09628) (Bowden-Arizona)

e harvesting procedures were used to remove ead minnows, Pimephales promelas nesque, from experimental ponds. The ods were complete periodic removal by drain-ncomplete periodic removal by seining, and 1 plete removal at the end of the season. dic complete removal by draining increased production in numbers of juveniles erlings) by 41%. After the 1st harvest, drain-arvested smaller fingerlings than seining did. rdless of the method used to harvest fin-gs, 1% handling mortality was observed. The ed optimum sex ratio and density of brood ould not be maintained due to natural adult lity. Water temperature and seston were in-ted by the drained harvest, but both ered quickly after refilling and did not appear tard production of fingerlings.--Copyright Biological Abstracts, Inc.

**RIMENTAL INTRODUCTION OF THE RALIAN CRAYFISH (CHERAX IMANUS) INTO LOUISIANA,**
rsity of Southwestern Louisiana, Lafayette. hireman.
Fish-Cult, Vol 35, No 2, p 107-109, 1973,

ptors: Crayfish, Crustaceans, Louisiana, h stages, Ponds.
iers: Australian crayfish, Cannibalistic sh, Cherax-Tenuimanus, Culture, *Marron, onstruction, Reproduction, Temperature.

marron (C. tenuimanus) attain weights in ex-f 4 lb and are extremely palatable, their al for commercial production in Southern ana, was investigated. Marron probably cannot exist in S Louisiana waters because of water temperature extremes, Even if established there are several factors unfavorable for commercial propagation. Pond construction would be costly since ponds would necessarily have to be deeper than existing crayfish ponds, and each pond should be enclosed so marron would not escape. If marron are density limited (to 100 ponds/acre), as Australian studies indicate, they are poorly suited for intensive culture purposes. Marron are cannibalistic; therefore size classes must be separated. This would necessitate rearing ponds which would not produce harvestable crops each year. The biological potential (growth and reproduction) is low as compared to native crayfish; it would take a number of years to realize returns on initial investments.--Copyright 1973, Biological Abstracts, Inc.

**INDEX 1945-1966, LAND AND WATER.**
Food and Agriculture Organization of the United Nations, Rome (Italy). Documentation Center
PU: DC/Sp. 8, May 1968. 421 p.

Descriptors: *Bibliographies, *Land resources, *Documentation, Information exchange, United Nations, Foreign countries, Agricultural engineering, Land management, Water management(Applied), *Water resources, Soil conservation, Irrigation.

Gathering, selection, analysis, and indexing of the Food and Agriculture Organization publications and documents produced from 1945 to 1966 is in process and will cover successively the broad fields assigned to the FAO technical and economical divisions. The present index - the sixth of a series of Divisional and Departmental indexes - covers most of the publications and documents produced from 1945 to 1966 by the Land and Water Division. It contains some 1300 entries in the bibliographical list, from which the subject index and the author index were derived. (Scott-ISWS)
W75-09635

**WATER FOR AGRICULTURE, ANNOTATED BIBLIOGRAPHY, AUTHOR AND SUBJECT INDEX.**
Food and Agriculture Organization of the United Nations, Rome (Italy). Documentation Center.
DC/Sp. 27, 1973. 776 p.

Descriptors: *Bibliographies, *Agriculture. *Documentation, *Information exchange, Groundwater, Hydraulic engineering, Foreign countries, United Nations, Geology, *Irrigation water drainage, Fertilizers, Hydrology, Floods. *Water resources, Water resources development, Water management(Applied), Equipment, Water balance, Maps, Soil science.

Food and Agriculture Organization publications and documents related to water in agriculture and issued between 1945 and 1973 by the Land and Water Development Division and by other technical Divisions were indexed. A large number of documents arising from the activities of FAO contain some reference to water for agriculture. The present index is therefore a selected list consisting of documents in which these activities are a predominant feature or those directly supporting them, such as reports and working documents dealing with Soil Science. The index consists of three parts: an analytical index, an index by authors, and a bibliographical list. (Scott-ISWS)

## 10D. Specialized Information Center Services

**U.S. ENGINEERING INFORMATION SERVICES AND THE ROLE OF THE WATER RESOURCES SCIENTIFIC INFORMATION CENTER,**
Office of Water Research and Technology, Washington, D.C. Water Resources Scientific Information Center.
R. A. Jensen.
The Journal of the Institution of Engineers, Australia, p 8-10, 12, 16, November-December 1974.

Descriptors: *Information exchange, *Information retrieval, *Water resources, *United States, Indexing, Abstracts, Publications, Bibliographies, Data collections, Water Resources Research Act, Thesauri, Documentation, Data storage and retrieval, Computers.
Identifiers: *Water Resources Scientific Information Center, Information analysis centers.

General subject areas discussed were: (1) the status of engineering information in the United States, (2) the role of the information analysis center in the engineering information system, (3) secondary services in water resources engineering, and (4) the Water Resources Scientific Information Center (WRSIC). The engineer operates in an information-communication pattern and has performed reasonably well within his present framework, however, there is mounting evidence that the existing engineering and information framework needs greater strengthening to meet the challenges of the future. The information analysis center comprises a group of specialists in science or technology, supplemented by librarians, computer specialists, and other information scientists, who acquire, select, store, analyze, evaluate, and synthesize information in their field of specialization. Such a center produces critical reviews, data compilations, measurement criteria, management recommendations, and other intellectual products requiring a high level of technical sophistication. WRSIC is an information analysis center which disseminates scientific and technical information for the U.S. water resources community. Input information to WRSIC is received from Federal water resources agencies, 51 State water resources research institutes, specialized documentation services, and approximately 13 designated centers of competence. Input information includes an abstract and index of each document entered on a precoded abstract form with other bibliographic data. Input from all sources, when merged, comprises a comprehensive, searchable, information base in machine-readable form. (Humphreys-ISWS)

W75-09824 8A

The Reserve Mining Case: Promises, Promises,
W75-09838 5G

Influence of the Energy Crisis Upon the Future of Environmental Policy,
W75-09847 6E

ENVIRONMENTAL ENGINEERING
Makeup Requirements for Cooling Ponds,
W75-09760 5G

ENVIRONMENTAL IMPACT
Evaluation of Environmental Impact of Landfills,
W75-09761 5C

ENVIRONMENTAL IMPACT STATEMENT
Charles River Dam, Boston, Mass (Final Environmental Impact Statement).
W75-09816 8D

Proposed Navigational Maintenance Dredging Project at Guilford Harbor, Guilford, Connecticut (Final Environmental Impact Statement).
W75-09821 8A

ENVIRONMENTAL IMPACT STATEMENTS
Maintenance of the Federal Navigation Project in Scarboro River at Scarboro, Maine (Final Environmental Impact Statement).
W75-09811 8A

Initial Stage, Oahe Unit, Pick-Sloan Missouri Basin Program, South Dakota (Final Environmental Impact Statement).
W75-09812 8A

Detailed Project Report for Local Flood Protection, Zacate Creek, Laredo, Texas (Final Environmental Impact Statement).
W75-09813 4A

North Fork Nolin River Watershed, Kentucky (Final Environmental Impact Statement).
W75-09814 8A

Ediz Hook Beach Erosion Control, Port Angeles, Washington (Final Environmental Impact Statement).
W75-09815 8A

Wastewater Treatment Facilities Construction Grants for the Lower Raritan River Basin and for the South Shore of Raritan Bay (Final Environmental Impact Statement).
W75-09817 5D

Table Rock Lake, White River, Missouri (Final Environmental Impact Statement).
W75-09818 8C

Bushley Bayou, Louisana (Final Environmental Impact Statement).
W75-09819 8D

Proposed 1973 Outer Continental Shelf Oil and Gas General Lease-Sale, Offshore Mississippi, Alabama, and Florida, Volume 2, Potential Environmental Impacts, Etc. (Environmental Impact Statement).
W75-09820 5G

Upper Mulberry River Watershed, Barrow, Gwinnett, Hall, and Jackson Counties, Georgia (Final Environmental Impact Statement).
W75-09822 8A

Crude Oil and Natural Gas Production and Other Mining Operations in Navigable Waters Along the Louisiana Coast (Final Environmental Impact Statement).
W75-09823 5G

Proposed Maintenance Dredging of the Channel from U.S. Coast Guard Santa Rosa Station Moorings to Navigable Watershed in Pensacola Bay (Final Environmental Impact Statement).
W75-09824 8A

Prevention and Mitigation of Shore Damages, Kahului Harbor, Maui, Hawaii (Final Environmental Impact Statement).
W75-09825 8A

Atchison, Topeka and Santa Fe Ry. Co. v. Callaway (Action by Railroad, Environmentalists and Others to Halt Reconstruction of Lock and Dam on Upper Mississippi River Navigation System by Defendant Corps of Engineers).
W75-09826 8A

Borough of Morrisville v. Delaware River Basin Comm'n. (Ruling on Motion to Dismiss Action by Communities Dependent on Delaware River Basin Comm'n. Which Action Was Founded on a NEPA Complaint).
W75-09827 6E

Conservation Council of North Carolina v. Costanzo (Action to Enjoin Construction of a Marina on Island in Atlantic Ocean and to Require Environmental Impact Statement by Corps of Engineers).
W75-09840 6E

ENVIRONMENTAL IMPACTS
Secondary Impacts of Transportation and Wastewater Investments: Review and Bibliography,
W75-09576 5C

ENVIRONMENTAL SANITATION
State of Arizona, Environmental Services Needs Study for Greenlee County, 1970-1990.
W75-09584 5D

EQUATIONS
The Composite Roughness of Ice Covered Streams,
W75-09758 2C

EQUIPMENT
Fluid Sampling Device,
W75-09422 7E

An Inexpensive Macroinvertebrate Bioassay Table for Use in Continuous-Flow Toxicity Tests,
W75-09676 5A

EROSION
Pore and Eroding Fluid Influences on Surface Erosion of Soil,
W75-09741 2J

EROSION CONTROL
Sectoral and Regional Economic Impact of Controlling Nonpoint Pollution in Forested Areas,
W75-09530 5B

ESTIMATING
Averaging Errors in Monthly Evaporation Estimates,
W75-09590 2D

ESTUARIES
Deposition of Zinc and Cadmium by Marine Bacteria in Estuarine Sediments,
W75-09692 5C

Sediment Resuspension and Deposition in Narragansett Bay,

A Laboratory Investigation of Surface Runoff,
W75-09744 2E

KOKANEE SALMON
Effects of Kokanee Salmon (Oncorhynchus Nerka) Decomposition on the Ecology of a Subalpine Stream,
W75-09672 5C

LABORATORIES
Automation in a Water Quality Laboratory Scheme,
W75-09723 5A

LABORATORY TESTS
Drag Reduction by Collapsed and Extended Polyelectrolytes,
W75-09601 8B

The Effects of Lapsed Time Since Feeding Upon the Toxicity of Zinc to Fish,
W75-09688 5C

Differentiation Between Natural Hydrocarbons and Low Level Diesel Oil Contamination in Cooked Lobster Meat,
W75-09698 5A

On the Discharge Coefficient of Nozzles f
Single- and Two-Phase Fluids,
W75-09739 8

Friction Factor Under Oscillatory Waves,
W75-09755 8

Rapid Temperature Reduction of Therm
Discharge,
W75-09757 5

LAG TIME
A Non-Linear Rainfall-Runoff Model, Provi
ing for Variable Lag Time,
W75-09753 2

LAGOON-SOIL SYSTEM
A Covered Domestic Lagoon System for Nat
ral Ground Water Recharge Near Metropolit
Areas,
W75-09524 5

LAGOON TREATMENT
A Covered Domestic Lagoon System for Nat
ral Ground Water Recharge Near Metropolit
Areas,
W75-09524 5

LAGOONS
Upgrading Lagoons.
W75-09386 5

LAJAS VALLEY (P.R.)
An Investigation of Factors Affecting the I
tensity of Water Use in the Lajas Valley Irrig
tion Project,
W75-09376 3

LAKE BOTTOMS
Silt Removal from a Lake Bottom.
W75-09575 5

LAKE DIKING
Water Quality Effect of Diking a Shallow Ari
Region Lake,
W75-09577 5

LAKE HERMAN (SODAK)
Silt Removal from a Lake Bottom.
W75-09575 5

LAKE HURON
The Prediction of Lake Huron Lake-Effec
Snowfall Systems,
W75-09748 2

LAKE OAHE (SD)
Initial Stage, Oahe Unit, Pick-Sloan Missou
Basin Program, South Dakota (Final Environ
mental Impact Statement).
W75-09812 8

LAKE ONTARIO
Dynamics of Turbidity Plumes in Lake Ontario
W75-09709 2

LAKE SEDIMENTS
The Effect of Sulfate and Manganese Dioxid
on the Release of Phosphorus from Lake Men
dota Sediments,
W75-09619 5

LAKE SUPERIOR
The Reserve Mining Case: Promises, Promises,
W75-09838 5

LAKES
Forest Fire: Effect on Phosphorus Movement
to Lakes,
W75-09364 5

Water Quality Effect of Diking a Shallow Arid-Region Lake,
W75-09577 5

. Saline Intrusion into Seneca Lake, New ork,
/75-09765 5B

ND APPLICATION
tilization of Digested Chemical Sewage ludges on Agricultural Lands in Ontario,
'75-09544 3F

ecent Sanitary District History in Land Recla- ation and Sludge Utilization,
75-09547 5E

steurization of Liquid Digested Sludge,
75-09552 5D

D DEVELOPMENT
izona's Remote Subdivisions: An Inventory,
75-09583 6G

D RECLAMATION
Investigation into the Potential Uses of ckle Irrigation for Desert Reclamation and dder Production in the Emirate of Abu abi,
'5-09487 4A

inage Materials.

# CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

**Supported by the Environmental Protection Agency in cooperation with WRSIC**

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

## Subject Fields

- NATURE OF WATER
- WATER CYCLE
- WATER SUPPLY AUGMENTATION AND CONSERVATION
- WATER QUANTITY MANAGEMENT AND CONTROL
- WATER QUALITY MANAGEMENT AND PROTECTION
- WATER RESOURCES PLANNING
- RESOURCES DATA
- ENGINEERING WORKS
- MANPOWER, GRANTS, AND FACILITIES
- SCIENTIFIC AND TECHNICAL INFORMATION

# SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
NOV 1 0
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 8, NUMBER 20
OCTOBER 15, 1975

-09851 -- W75-10350
DEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

# SELECTED
# WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

**VOLUME 8, NUMBER 20**
OCTOBER 15, 1975

W75-09851 -- W75-10350

cretary of the U. S. Department of the Interior has determined that the publication of this periodical is neces-
the transaction of the public business required by law of this Department. Use of funds for printing this pe-
l has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

# FOREWORD

**Selected Water Resources Abstracts,** a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

**Selected Water Resources Abstracts** is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

## CONTENTS

FOREWORD----------iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

**01** NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

**02** WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

**03** WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

**04** WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

**05** WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

**06** WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

**07** RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

**08** ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

**09** MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

**10** SCIENTIFIC AND TECHNICAL INFORMATION

WMO No. 399, Geneva (Switzerland), p 81-99, 1974. 3 fig, 1 tab, 13 ref. NSF Grants GA-24647, GA-36910X.

Descriptors: *Cloud seeding, *Numerical analysis, *Weather modification, Clouds, Winds, Water vapor, Rain, Ice, Graupel, Hail, Precipitation(Atmospheric), *Model studies, Salts, *Simulation analysis.
Identifiers: Potential temperature, Cloud water, Salt seeding.

A two-dimensional time-dependent cloud model with 200-meter grid spacing covering an area 19.2 km square was used to simulate cloud seeding experiments. Atmospheric wind, potential temperature, water vapor, cloud liquid, rain, cloud ice, and graupel were the primary dependent variables. Extension of the model to deep convection was made by using a density-weighted stream function. The model was used to simulate a natural cloud, ice phase seeding of both light and heavy cases, salt, and combinations of seeding agents. It was found that the cases studied resulted in pessimistic conclusions which may be modified when more realistic conditions are included in the model. It was also concluded that cloud modeling may be used to help develop a more quantitative rationale for many cloud seeding experiments. (See also W75-09944) (Jones-ISWS)

In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 89-94, 1974. 7 fig, 5 ref.

Descriptors: *Weather modification, *Artificial precipitation, *Forest fires, Cloud seeding, Model studies, Mathematical models, Rainfall, Cloud physics, Precipitation(Atmospheric), Silver iodide, Nucleation, Meteorology, Theoretical analysis.

Recently, the artificial stimulation of rain has become widely used in extinguishing forest fires in the Soviet Union. Convective clouds 2.0-2.5 km thick and more which are moving towards the fire are seeded. Two essential questions were theoretically solved: (1) the optimal expenditure of seeding agent to produce maximum precipitation, and (2) the distance at which the cloud should be seeded so that the precipitation falls directly onto the fire. Curves and nomograms were presented to show the optimum seeding rates and the best location for the seeding relative to the fire. (See also W75-09944) (Sims-ISWS)

P. Admirat.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 197-206, 1974. 5 fig, 2 tab, 8 ref.

Descriptors: *Hail, *Storms, *Energy, Size, On-site investigations, On-site data collections, Weather modification, Cloud physics, Precipitation(Atmospheric), Meteorology.
Identifiers: *Hailcores, Hailpads, Hail collectors, *France.

Preliminary results were described for studies of natural hailstorms in France. These studies have been carried out since 1971 in the 'Languedoc' Project, whose experimental field is situated in the viticultural plain of Languedoc near Montpellier. Hailpads and refrigerated hail collection boxes were used. The study of the distribution of the numbers and diameters of hailstones falling from natural storms shows that certain relations exist between these two parameters, the most important of which are: (1) the simultaneous variation of the total number of hailstones and their maximum diameter from one point to another, and (2) the inverse relation between the number of hailstones and their diameter at one point. These relations characterize natural 'hailcores' which are real areas of hail accumulation at ground level where all the energy of the hailfall is concentrated. Hailcores are probably the result of a 'dumping' of the accumulation zone in the storm cloud. From the natural distribution of the numbers and the diameters of the hailstones, the future structure of hailcores modified by seeding can be calculated and the criteria which will enable measurement of the efficiency of the hail prevention systems can be established. When hailcores are destroyed, hail prevention techniques will be successful. (See also W75-09944) (Sims-ISWS)

**RESEARCH INTO HAIL-FORMING PROCESSES AND THE RESULTS OF ANTI-HAIL PROTECTION MEASURES IN MOLDAVIA,**
Central Aerological Observatory, Moscow (USSR).
I. I. Gaivoronsky, L. A. Dinevitch, and N. M. Zaitchenko.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 217-223, 1974. 5 fig, 1 tab.

Descriptors: *Weather modification, *Hail, *Rainfall, Cloud seeding, Climatology, Precipitation(Atmospheric), Storms, Atmospheric physics, Cloud physics, Meteorology, On-site investigations.

Identifiers: *Hail prevention, *USSR(Moldavia).

In Moldavia, a comprehensive investigation was conducted of the evolution, including the regeneration, of thunder- and hail-clouds both under natural conditions and when subjected to artificial modification. Moldavia is one of the areas of the Soviet Union in which intensive hail-forming processes take place fairly frequently. In an average year, 10% of the territory is affected by hail. An analysis was carried out of mean total precipitation during the warm half-years before protective measures were taken and during analogous periods after protection. This analysis showed that when large-scale anti-hail experiments were carried out, the amount of precipitation on the protected and control territories increased as compared with the long-term data series. Since 1965, there has been a marked reduction in the size of the hail-damaged area in the protected territory as compared with the pre-protected period, while in the control areas, during the same period the level of hail damage remained within its former limits. In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 231-237, 1974. 5 fig, 10 ref.

Descriptors: *Weather modification, *Hail, *Model studies, *Cloud physics, Mathematical models, Atmospheric physics, Cloud seeding, Supersaturation, Condensation, Temperature, Moisture, Crystals, Radar, Storms, Precipitation(Atmospheric), Meteorology.
Identifiers: *Hail suppression, USSR.

Calculations for convection were performed on the basis of the jet theory in a stratified atmosphere. The influence of latent heat accompanying phase changes (during condensation, crystallization, coagulation of different-phase particles) on the convection velocity as well as on the temperature gradient, vapor supersaturation, specific liquid-water content, and horizontal extent of cloud was taken into consideration in the principal equations for convection with regard to flow inertia. The whole system of equations for a hail cloud consisted of 19 differential nonlinear equations of first-order and 29 algebraic equations which were solved by electronic computers. The processes of hail formation and its suppression by inducing crystallization are extremely complex. Only complete calculations concerning the in-cloud processes taking into account thermodynamic irreversibility and regenerative coupling between internal processes in clouds and convection parameters give an idea of the process as a whole. Seeding cannot be successful without correct calculations. The intensity of the process of hail growth, both natural and artificially transformed, proves to be highly dependent on one or two main factors under certain conditions. In this sense, the cloud, with respect to the hail growth process, proves to be metastable. Comparatively small changes in the parameters (temperature, the profile of temperature or wind) may result in radical changes in the hail growth process, i.e., they can intensify or reduce it. R. C. Gentry.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 245-254, 1974. 5 fig, 1 tab, 11 ref.

Descriptors: *Weather modification, *Hurricanes, *Winds, *Cloud seeding, Wind velocity, Rain, Surges, Atmospheric pressure, Tropical cyclones, Storms, Model studies, On-site investigations, Silver iodide, Nucleation, Cloud physics, Atmospheric physics, Meteorology.

Hurricane modification experiments have been conducted in the United States since 1961, and recent experiments have been by Project STORMFURY, an interdepartmental effort of the Departments of Commerce (NOAA) and Defense (Navy and Air Force). Hurricane Debbie was seeded five times within 8 hours on 18 August 1969 and again on 20 August 1969. The maximum winds measured and recorded by highly instrumented aircraft flying at 3600 m decreased 30% from 50 mps before the first seeding on 18 August to 35 mps 5 hours after the fifth seeding. The maximum winds, which had meanwhile returned to the original levels, decreased on 20 August from 51 mps before the first seeding to 43 mps within 6 hours after the fifth seeding or by about 15%. Calculations with hurricane models suggest that the proper area in which to enhance the heating in a storm is the area outside the radius of maximum vertical motion (the eyewall) which in a mature hurricane usually coincides with the belt of maximum winds. It was hypothesized that seeding in these areas will result in a new eyewall developing radially outward from the old one, a reduction in the maximum pressure gradient, a reduction in the maximum winds, and a reduction in the moving of the belt of maximum winds to a greater distance from the center. An important condition for experiments on co
trolling the electrical activity of clouds is t
availablility of equipment for use not only during
storm but also at the pre-storm stage in convecti
cloud development. Some definite results ha
been obtained in this direction. A special install
tion that enables monitoring both storm and pr
storm stage in convective cloud developmer
Some definite results have been obtained in th
direction. A special installation that enables mo
toring both storm and pre-storm stages of a co
vective cloud was made in the High Mounta
Geophysical Institute. This equipment was used
the study of electromagnetic energy radiation fro
clouds. In addition, the measuring apparatus i
cludes an electrical fluxometer and a centimet
wave-band radar. During the final experiments,
ten-centimeter radar technique was used whi
enabled more accurate location of thunderstor
discharges. According to the nature of the radi
tion field, one may distinguish three stages in thu
derstorm development: pre-storm, storm, a
after-storm. These stages are distinguished
spectral distributions of radiation field intensity
terms of duration and frequency of pulse parc
radiation. Preliminary experiments on cumulonim
bus modification at the pre-storm stage show
that is possible to affect the degree of electrical a
tivity and thus the radiation field. However, it
probably easier to intensify the storm activity th
to reduce it. The experiments show that as t
storm processes develop under natural conditio
(or after artificial modification) the radiation fie
charcteristics vary noticebly. (See also W7
09944) (Sims-ISWS)

Lightning suppression.

The choice of a method of controlling thu
derstorm electricity is predetermined by the natu
of the processes involved in the formation of thu
derstorm. A clear picture of current theories o
these processes is a necessary prerequisite
selecting an appropriate method. All theories su
gested three possible bases of electrificatio
mechanisms; the ions of the atmosphere, contra
potentials, and the atmospheric electric fiel
Further examination of thunderstorm electricit
theories indicates that the mechanisms of ion ele
trification cannot produce the formation of ele
tric charges and fields such as are observed i
thunder clouds. If atmosphere pollution does co
tribute the thunderstorm activity, the influenc
cannot be great. Therefore, it is considered th
contact electrification mechanisms are not funda
mental in generating thunderstorm activity an
that modification efforts in this direction are n
justified. Because of the high conductivity
thunder clouds, the process of formation and div
sion of charges within them must be continuou
and must be of great intensity. The mechanis
which appears most likely to provide such a rapi
formation and division of charges is the collisio
of hailstones and ice pellets with liquid drops
the electric field of a cumulonimbus cloud. T
study the collective effect the corona discharg
from a system of dischargers was investigated
This method may play an important role in th

rocess of suppression of the thunderstorm ischarge development. (See also W75-09944) Sims-ISWS)

escriptors: *Weather modification, *Cloud seed-g, *Bubbles, Laboratory investigations, rops(Fluids), Cloud physics, Atmospheric ysics, Precipitation(Atmospheric), Meteorolo-.
entifiers: *Charged bubbles, Electric charges.

e feasibility of cloud modification by charged uid bubbles was discussed in 1965. The problem the charged bubbles' interaction with a water rosol is characterized by so-called intermediate ynolds numbers (10-100). Thus, it is impossible obtain an adequate estimate of the collection ef-iency of cloud droplets by charged bubbles thout theoretical studies of the phenomenon er this range of Reynolds numbers. The aim of s investigation was to study the characteristics the charged bubbles' coagulation growth. On basis of experimental data on collection effi-ncy, tentative estimates of the droplets' wash-rate from stratiform clouds were obtained. The lection of cloud droplets by charged bubbles s studied by using two techniques: (1) obtaining a on the collection efficiency of monodispersed ud droplets by a charged sphere-collector by ulating the process in a small wind tunnel, and fog modification by charged bubbles in a cloud mber 3200 cu m in volume. It was estimated t when a cloud 1 cu km in volume with a liquid er content of 0.3 g/cu m is modified, the uired reagent amount is, according to the esti-es, bout 0.6 tons for bubbles and 3 tons for plets respectively, for a time of 30-35 min. Identifiers: *USSR, *Hail suppression, Cloud growth.

Radar observation of convective clouds and their modification with the aim of hail prevention have been carried out since 1969 in the northern part of Phergana Valley in Uzbekistan. Based on X-band radar observations and radiosonde data, certain cloud characteristics were obtained. Observational data for 1969-1972 were analyzed of hail-, shower- and non-precipitating clouds. This data satisfied the following conditions: (1) The distance between a cloud and the radar system did not exceed 30 km, because there would be a considerable error in the radar-echo height determined over longer distances due to the finite width of the radar beam directivity diagram. (2) The given cloud was not yet seeded with reagent. For hail-cloud modification, the reagent (AgI or PbI2) was injected by rockets into the zone 0-3 km from the right front of the cloud base because there were updrafts in this area. Simultaneously, the reagent was introduced by 'Elbrus-2' shells into the upper part of the cloud just before the increased reflectivity zone at isotherm levels -9 to -20C. Modification undertaken in the Phergana Valley resulted in a rather high efficiency of anti-hail protection with a consequent benefit to agricultural activities in the protected areas. In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 385-394, 1974. 4 fig, 10 ref.

Descriptors: Rainfall, *Hail, *Convection, *Model studies, Clouds, Cloud physics, Winds, Moisture content, Cloud seeding, Weather modification, Meteorology, Thermodynamics.
Identifiers: *Bulgaria, Hail suppression.

Among the various mesoscale meterological processes, convection plays the most significant role, especially where this is related to the formation of cumuliform rain clouds. A study has recently been started, based on certain relationships observed in the convective process, to investigate the role of the energy of instability in the development of convection, or more specifically, to find a relation between the maximum intensity of precipitation from a convective cloud and the total energy of instability in the appropriate layers of the atmosphere. The relation found shows that the total energy of instability in the layer between 700 and 500 mb plays a fundamental role in the process within cumuliform shower clouds and consequently in the intensity of rain from such clouds. The influence of other factors on the intensity is comparatively small. (See also W75-09944) (Sims-ISWS)

RADAR CHARACTERISTICS OF CUMULONIMBUS CLOUDS DURING THEIR NATURAL DEVELOPMENT AND ARTIFICIAL SEEDING,
Akademiya Nauk Gruzinskoi SSR, Tiflis. Institut Geofiziki.
A. I. Kartsivadze, and T. G. Salukvadze.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR), WMO No 399, Geneva (Switzerland), p 465-472, 1974. 5 fig, 3 tab, 5 ref.

Descriptors: *Weather modification, *Hail, *Cloud seeding, *Evaluation, Statistics, Cloud physics, Radar, Atmospheric physics, Meteorology.
Identifiers: *Hail suppression, *USSR(Alazani Valley).

An attempt was made, based on several years' radar measurements, to make some physico-statistical evaluations of the results of seeding of hail-dangerous clouds in the Alazani Valley (the Georgian SSR) by using rockets with crystallizing reagents. Over a period of 7 months in 1972, 461 dangerous clouds were seeded over the protected area of 600,000 hectares in the Alazani Valley. Based on calculations, 105 hail cases had to be expected with practical reliability; in fact, there were only 10. Thus, the efficiency of seeding was expressed in the probable decrease of the number of hail cases by about 90%. Evaluations of this kind are performed every year and indicate the high degree of efficiency of seeding in the Alazani Valley. Physico-statistical analysis of the large amount of experimental material allows demonstration of the effect of seeding, expressed both in the change of the developmental dynamics of cumulonimbus clouds and in the decrease of the number of the hailfalls from these clouds. ON THE CHARACTERISTICS OF SINGLE-CELL SHOWERS,
Iowa State Univ., Ames.
H. C. Vaughan, and K. L. Rancourt.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR), WMO No 399, Geneva (Switzerland), p 473-482, 1974. 7 fig, 3 tab, 9 ref.

Descriptors: *Rainfall, *Weather modification, *On-site data collections, *Iowa, Radar, Rain gages, Thunderstorms, Rain, Distribution patterns, Precipitation(Atmospheric), Cloud physics, Raindrops, Rainfall intensity, Rainfall disposition, Meteorology, Air masses.
Identifiers: *Showers.

The rainfall pattern of Iowa during July and August consists of air-mass showers and thunderstorms. This investigation was initiated in an attempt to answer some questions regarding availability of precipitable water and the efficiency of precipitation in a convective cloud and to better understand the natural precipitation process. All measures were made at the Kelly Farm Radar Facility located 5.7 km west-northwest of Iowa State University in an area of gently rolling farm land. The facility consists of two SCR-584 search radars, one of which has been extensively modified and modernized to operate as a short-pulse, high-resolution, 3.2-cm unit. Located 8.9 km north-northwest of the facility is a 23.3-sq km test area with 16 raingages in a square matrix. To obtain the complete history of a single-cell shower by using a raingage network, it would be desirable to have a larger and finer-spaced grid of raingages; i.e., at least 400 sq km with 441 raingages. The instruments used in this grid should be large-orifice, high-resolution, recording gages. In addition, a high-resolution, short-pulse radar to supplement the raingage network, would be desirable. The presence of high-intensity rain shafts within a single cell can significantly bias the raingage data, depending on whether the shafts pass in close proximity to a recording point and whether the horizontal movement of the shower is rapid. From the data available, it seems that even very intense and fast-moving showers would have a comparatively uniform precipitation pattern if it were not for their forward motion. Also, the variation in rainfall intensity within a cell increases with increased cloud top. (See also W75-09944) (Sims-ISWS)

Descriptors: *Minnesota, Climates, Precipitation(Atmospheric), Precipitation gages, Precipitation intensity, Rainfall disposition, Probable maximum precipitation, Cities, Areal.
Identifiers: *Minneapolis-St. Paul Metropolitan Area(Minn).

A study was made of the daily precipitation at 25 stations within a 30-mile radius of the Minneapolis-St. Paul airport from May-September for the 5-year period 1964-1968. The frequency of daily rains of 0.01 inch or more indicated by a single gage was about 35% while in reality the frequency was closer to 65%. The number of gages required for a 'true' sample varies from about 45 in May and June to 60 in July. The area of a rain was generally least in July and greatest in June. The maximum daily rainfall recorded equalled 7.98 inches and the greatest total monthly rainfall was 11.85 inches. Precipitation was lower at the airport site. (See also W75-14763) (Walton-Minnesota)

In a statistical-dynamical study of the atmosphere, the dependent variables of the dynamic equations constitute the continuous coordinates of a phase space in which an ensemble of possible states develops with time, according to the equations. However, the prediction of precipitation requires upward, not downward, winds and saturated, not unsaturated, air. These dichotomous features introduce first-order discontinuities in the dynamics at the time of condensation. It was shown that these discontinuities do not prevent the continuous transformation of a model ensemble with time, so that theoretical probabilities of atmospheric states are still possible both before and after precipitation begins. By means of the probability calculus, a model was developed to predict a theoretical probability of precipitation occurrence. Examples were given to illustrate these methods. (Sims-ISWS)

**AN EXPERIMENTAL STUDY OF THE DETECTION OF ICE NUCLEI ON MEMBRANE FILTERS AND OTHER SUBSTRATA,**
National Center for Atmospheric Research, Boulder, Colo.
G. Langer, and J. Rodgers.
Journal of Applied Meteorology, Vol 14, No 4, p 560-570, June 1975. 10 fig, 3 tab, 25 ref.

Descriptors: *Instrumentation, *Laboratory equipment, *Nucleation, Clouds, Filters, Membranes, Silver iodide, Ice, Supersaturation, Humidity, Condensation, Laboratory tests, Meteorology, On-site investigations, Air pollution, Pollutant identification.
Identifiers: *Ice nuclei.

An experimental study was made of a membrane filter technique for the detection of ice nuclei in which air of controlled humidity flows across the cooled membrane as opposed to the usual static thermal diffusion procedure. This is necessary to overcome water vapor losses to various sinks on the sample substrate; the procedure also makes it possible to observe the nucleation process directly by microscope. However, for very small nuclei such as AgI, even this flow system is not able to activate the nuclei. This is overcome by letting a puff of supersaturated air pass over the deposited aerosol, which should be on a water-repellant substrate, to promote vapor flow to the ice and condensation nuclei, rather than onto the substrate. At temperatures warmer than -12C, the puff procedure is not necessary since the water vapor pressure is sufficient to keep up with the vapor sinks. By following the above procedures, consistent results were obtained for AgI, kaolin, soil particles, and pollution aerosols in both laboratory and field applications in the -5 to -20C range. ysis, Spectrometers, Infrared radia
Meteorology, On-site data collections.
Identifiers: *Radiometers.

An experiment was undertaken to measure
equivalent blackbody temperature of cloud to
a severe storm. This was done to evaluate the
mon meteorological practice of determining c
top altitude by equating the equivalent black
temperature to the corresponding tempera
from a nearby radiosonde and to provide data
determining radiative heat transfer mechanism
the cloud top. Near Graham, Texas, infrared s
tra in the spectral range of 6.7 to 13.3 microns
collected 29 April 1970 from the top of a se
storm 12.4 to 14.0 km in altitude. Absolute alti
of the cloud tops was determined by AS-1
plotter analysis of stereo pairs of photogr
taken with an RC-8 camera. The equiva
blackbody temperature of the cloud top was d
mined by fitting the Planck radiation functio
the data. The radiometrically derived tempera
of the cloud top is -4 to +7 K warmer than th
vironmental temperature as determined
radiosonde data for any given storm top altit
Two temperature anomalies approximately 5
in diameter were found near opposite sides o
km wide and 13.8 km high cloud tower. Eac
these anomalies is 6 to 9 K warmer than the
rounding cloud equivalent blackbody tempera
of 209 K. It was proposed that the anomalies
served are dry air subsidence on the edge of a
draft that perturbs cloud particle spectra. Th
frared extinction coefficient due to the clou
decreased and thermal radiation from the int
of the warmer cloud is allowed to escape. (S

ntifiers: *Snow enhancement, Seeding pat-s, Snow crystals.

insight into the interrelationship between eral parameters--some of them are microscale, e are mesoscale--in nature has brought the un-tanding of the snow process into sharper us. The most important mesoscale parameter is rate of condensation which determines the unt of moisture released for precipitation. The t important microphysical parameter is the centration of snow crystals furnished by na-. The concentration of snow crystals was vn to depend on two factors: (1) the concentra-of freezing nuclei and (2) the rate of upward of freezing nuclei. Precipitable water in a d appears in two forms: (1) as liquid water ed in the cloud and (2) as water released by the of updraft in the condensation process, that y the rate of cndensation. Snowfall enhance-t opportunities may present themselves ugh the microscale mechanism of snow forma-as well as through the mesoscale flux parame-of cloud systems. Convective stratocumulus ems, upslope stratocumulus systems, and onic shallow cloud systems were shown to potential for cloud seeding. Techniques of ing for snow enhancement were discussed, the merits of various seeding patterns were ribed. Some results of snow enhancement ects were reported. (See also W75-09944) s-ISWS)

## 2D. Evaporation and Transpiration

EFFECTS OF IRRIGATION AND ROW SPACING ON EVAPOTRANSPIRATION AND MICROCLIMATE OF A SORGHUM FIELD,
Kansas State Univ., Manhattan Evapotranspiration Lab.
E. T. Kanemasu, and W. L. Powers.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 557, $4.25 in paper copy, $2.25 in microfiche. Kansas Water Resources Research Institute, Manhattan, Contribution No. 166, May 1975. 54 p, 7 tab, 16 fig, 4 ref. OWRT A-056-KAN(1). 14-31-0001-3816.

Descriptors: *Evaporation, *Transpiration, *Irrigation effects, *Evapotranspiration, Microclimatology, *Sorghum, *Kansas, *Model studies, Energy budget, Advection, Carbon dioxide, Wheat, Soybeans, Crop production, Furrow irrigation, Cover crops.
Identifiers: *Net carbon dioxide exchange, Manhattan(Kan).

An evapotranspiration model was tested over the 1973 growing season at Manhattan, Kansas. The model predicted daily evapotranspiration rates that were within 1 to 2 mm of lysimetric estimates. Evaporation accounted for 22% of the seasonal evapotranspiration. Energy balance over wide and narrow row sorghum indicated within row advection early in the growing season and large scale advection at near maturity. Advection was greater in the wide-row sorghum. Seasonal evapotranspiration rates were 54 and 52 cm for the narrow and wide row sorghum, respectively. Hourly net carbon dioxide exchange rates were determined for wheat, sorghum and soybean. Sorghum canopy had nearly twice the net carbon dioxide exchange of the wheat and soybean canopies.

Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 562, $4.25 in paper copy, $2.25 in microfiche. Kansas Water Resources Research Institute, Manhattan, Contribution No 164, May 1975. 66 p, 11 fig, 7 tab, 28 ref, 2 append. OWRT A-050-KAN(1). 14-31-0001-3516.

Descriptors: *Evapotranspiration, *Streamflow, *Agricultural watersheds, Runoff, Evaporation, Transpiration, Soil moisture, Hydrographs, *Kansas, *Simulation analysis, Rainfall, *Model studies, *Forecasting, Crop production, Distribution, Data collections, Dry seasons.
Identifiers: *Watershed models, Penman Combination equation, *Black Vermillion Watershed(Kan).

A new evapotranspiration (ET) function for the Kansas Water Budget model is developed and tested on the Black Vermillion watershed in Northeastern Kansas. The purpose of the new ET function is to improve the response of Kansas model to daily climatic changes and to the distribution and stage of growth of crops on an agricultural watershed. The new function uses the Penman Combination equation modified by three coefficients which account for, (1) the soil moisture availability, (2) the increased soil surface evaporation following rainfall, and (3) for the crop transpiration efficiency which varies with the crop and the stage of growth. The new function was programmed into the present Kansas model and both the present and the revised models were applied to the Black Vermillion for comparison purposes. Improvements were noted in daily and weekly responses of the revised model. In particular, the overall correlations of calculated to observed daily streamflows for the 1954 through 1967 study period were improved from 0.58 to 0.78 with the revised model. The significant improvement in streamflow simulation accuracy requires a modest increase in required input data and computer time. If planning efforts revolve around optimizing yields from agricultural watersheds, the extra costs would be warranted.

AN INVESTIGATION OF THE PREDICTIVE ABILITY OF SEVERAL EVAPORATION EQUATIONS,
California Univ., Davis. Dept. of Chemical Engineering.
F. W. Pierson, and A. P. Jackman.
Journal of Applied Meteorology, Vol 14, No 4, p 477-487, June 1975. 5 fig, 4 tab, 16 ref, 1 append.

Descriptors: *Evaporation, *Equations, *Forecasting, Atmosphere, Meteorological data, Drag, Velocity, Eddies, Momentum transfer, Friction, Momentum equation, Temperature, Water vapor, Wind velocity, Humidity, Profiles, Diffusivity.
Identifiers: *Flux-gradient equations, Log-law equations.

A number of integrated flux-gradient type evaporation equations were tested by using accurate evaporation and meteorological data. The estimated evaporation was compared with the measured evaporation. Most of the equations originally were derived by assuming that the ratio

of the eddy diffusivity of momentum to the eddy diffusivity of water vapor is constant. Since recent developments have shown that this ratio is a function of atmospheric stability, these equations were revised to admit variability of the ratio and were tested in the revised form. The momentum flux appeared in all evaporation equations tested. Results showed that the accuracy of the evaporation estimation was critically dependent on the accuracy of the momentum flux estimation by the velocity profile equation from which the evaporation equation was derived. In general, profile equations that produce momentum fluxes in good agreement with measured values produce accurate evaporation equations. Of the equations tested, an evaporation equation based on the Brooks wind velocity profile equation and a modified form of the Deacon and Swinbank evaporation equation were found to be the most accurate. A semi-empirical equation proposed by Pruitt was also found to give good results, but may require further calibration. (Roberts-ISWS)

## 2F. Groundwater

**TATUS OF LAND SUBSIDENCE DUE TO GROUND-WATER WITHDRAWAL ALONG HE MISSISSIPPI GULF COAST,**
Mississippi State Univ., Mississippi State. Dept. of Geology and Geography.
). M. Keady, T. W. Lins, and E. E. Russell.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 558, 3.75 in paper copy, $2.25 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, July 1975. 25 p, 5 fig, 6 ref. OWRT A-085-MISS(1).

Descriptors: *Land subsidence, Mississippi, Gulf of Mexico, Subsidence, *Withdrawal, Groundwater, *Compaction, Consolidation, Stress, Aquitards, Water level fluctuations, Aquifers.
Identifiers: *Mississippi Gulf Coast, Preconsolidation.

Land subsidence due to ground-water withdrawal along the Mississippi Gulf Coast has not occurred to the measurable extent that it has in New Orleans, La., Baton Rouge, La., and the Houston, Texas, area. A potential for subsidence exists, and future large-scale ground-water developments make the possibility of subsidence important. The quantity of water produced, as well as water-level declines, should be considered in estimating potential for subsidence. Using the average specific-unit compaction value measured in the Houston, Texas area, subsidence due to ground-water withdrawal along the Mississippi Gulf Coast is estimated to be a few inches at most. Decreases in elevation of bench marks of about four to five inches are common along the coast, but this subsidence is attributed to tectonic activity and other causes. An unknown factor is 'preconsolidation' in the aquitards by loading and unloading, particularly as a result of the fluctuations of sea level during the Pleistocene Epoch. Stresses on the aquitards produced by ground-water withdrawal would have to exceed prior loading stress before significant amounts of compaction and land subsidence could occur.

Descriptors: *Aquifer characteristics, Aquifer systems, *Groundwater movement, Aquifers, Groundwater, Groundwater basins, Groundwater recharge, *Calcite, Gypsum, Carbon dioxide, Sodium chloride, *Mixing, Saturation, *New Mexico, Chemical analysis, *Tracers, Soil tests.
Identifiers: *Roswell(NMex), Groundwater basin, Confined limestone aquifer, Aquifer mixing, Chemical tracers.

Soil column tests and chemical analyses of water samples from the Roswell ground water basin indicate that water is saturated with calcite before entering the aquifer. It is postulated that calcite precipitation and dissolution occurring within the aquifer result from nonlinear mixing effects. Four such effects are developed and applied to the Roswell ground water basin. Mixing caused by leakage from the unconfined to the confined aquifer is clogging the confined aquifer with a white precipitate. (Hain-New Mexico State).

Identifiers: *Livermore Valley(Calif), *Sunol Valley(Calif).

Livermore and Sunol Valleys are part of the rapidly urbanizing metropolitan region surrounding San Francisco Bay. These two valleys contain three basic resources: land, gravel, and water. In the late 1940s and during the 1950s, water demand exceeded supply and groundwater levels declined. This trend has been stopped by the availability of a new water supply to the area from the Del Valle Reservoir. The present studies of the area will develop a better understanding of the groundwater resources leading to development and testing of alternative plans for conjunctive use of surface, ground, and waste waters. The geology and hydrology of the area were reported in sufficient detail to permit planning for use of the groundwater. (Sanderson-ISWS)

Descriptors: *Water table, *Beaches, *Fluctuations, *Hydrology, *Mathematical models, Groundwater, Tidal effects, Intertidal areas, Sea water, Tropical regions, Sand aquifers, Chemical properties, Computer programs.
Identifiers: Grand Cayman Island.

A simplified mathematical model for beach groundwater fluctuations driven by tidal oscillations was developed and tested. The interstitial beach groundwater chemistry across a carbonate beach profile over several tidal cycles is described. The model was developed from nonlinear partial differential equations governing transient, one-dimensional movement of groundwater through porous media. A finite-difference algorithm for a digital computer was developed to solve the equations. Beach homogeneity and nonlinear boundary conditions imposed by tidal fluctuations were assumed. Field measurements of water table fluctuations in Galleon Beach, Grand Cayman Island show that the mathematical model simulates this system within the limits of accuracy of experimental measurements. A method for in situ determination of the permeability-porosity ratio is proposed and demonstrated. Results from the study of the chemical environment showed that the carbonate beach may be divided into two zones: a freshwater zone containing high dissolved carbonates but very low salinity and a seawater-dominated intertidal zone containing salinity close to that of seawater and about half as much dissolved carbonates as the freshwater zone. The calculated values showed that the local surface seawater was constantly supersaturated with calcite, whereas the interstitial waters, especially in the intertidal zone, where considerably undersaturated. (Jones-Wisconsin)

**GROUND WATER,**
Geological Survey, Denver, Colo.
M. S. Bedinger.
Water Spectrum, Vol 6, No 1, p 19-26, Spring 1975. 5 fig, 5 photos.

Descriptors: *Groundwater resources, *Water resources development, *United States, Groundwater availability, Water management(Applied), Groundwater potential, Groundwater basins, Water yield, Water quality, Aquifer characteristics, Hydrogeology, Hydrology, Planning, Groundwater movement, Hydrologic cycle, Water balance, Thermal stress, Environmental effects, Water utilization.

This article describes the role of groundwater as an integral part of the overall water resources of the Nation, the relations between environmental stress and groundwater response, and methods of scientific groundwater management, and it illustrates the relation between groundwater and environmental stress by a few case histories. About 180 billion acre-feet of potable water lies within a few thousand feet of the American land surface. At the present time only about 20 percent of our withdrawals for uses other than hydropower generation comes from groundwater. The proper application of scientific principles in developing and managing our groundwater resources is essential. Stresses on an aquifer, both natural and man induced, can be classified as hydraulic, thermal, and chemical. The response to any given stress will be in accordance with the laws of conservation of energy and mass. The equation of continuity, inflow minus outflow = change in storage, is a means of stating the mass balance equation when considering the hydraulic stress and response in the system. Similar equations could be expressed regarding the thermal and chemical balance in the aquifer. (Woodard-USGS)

R. A. Rappmund.
Edwards Underground Water District, San Antonio, Texas, Bulletin 34, July 1975. 8 p, 1 tab, 14 ref.

Descriptors: *Groundwater resources, *Pumping, *Water yield, *Water utilization, *Texas, Aquifer characteristics, Water wells, Withdrawal, Hydrologic data.
Identifiers: *San Antonio area(Tex), Edwards and associated limestones, Groundwater discharge.

The estimated total well and spring discharge from the Edwards and associated limestones in the San Antonio, Texas, area during 1974 was 847,500 acre-feet, which is the record high for the period 1934-74. The total discharge from wells and springs for 1974 was about 1% more than in 1973 and 53% more than the average for 1934-73. About 43% of the total discharge came from wells, and approximately two-thirds of the well discharge was from wells in Bexar County. Well discharge in 1974 was 17% more than in 1973, while springflow decreased by about 8%. (Woodard-USGS)

Identifiers: *Garner Valley(Calif).

Garner Valley is an intermontane alluvial basin in the San Jacinto Mountains, California. An alluvial aquifer with a surface area of 21 square miles underlies the valley floor. A finite-element mathematical representation of the aquifer was used to compute average annual recharge and discharge. The aquifer is in an equilibrium state and recharge from precipitation equals groundwater discharge to phreatophytes and to Lake Hemet, a reservoir in the northern part of the valley. The average annual recharge is about 2,200 acre-feet. The average annual discharge to the phreatophytes is about 1,150 acre-feet, the average annual dishcarge to Lake Hemet is about 1,000 acre-feet, and the average annual discharge via other minor avenues is about 50 acre-feet. Water developers in an adjacent drainage basin are considering the annual export of 400 to 900 acre-feet of groundwater from Garner Valley, which would result in an equal reduction of the natural groundwater discharge in the valley. Descriptors: Water table, *Percolation, *Computer models, Evapotranspiration, Root zone, Seepage, *Soil moisture, Model studies, Moisture content, Porgramming languages.

A computer model was developed that simulates the quantity and movement of moisture involved in the deep seepage process. The deep seepage process extends from the bottom of the root zone, in the unsaturated flow region, down to the phreatic surface. The model is written in the modeling language CSMP. In one submodel, termed the Root Zone Model, a water balance is used, with measured precipitation and temperature as inputs, to evaluate the processes of runoff, evapotranspiration, root zone storage, and deep seepage. The deep seepage that percolates below the root zone moves down towards the water table. This downward motion is modeled in a submodel called the Deep Seepage Model. The input to this model is the pattern of deep seepage derived from the Root Zone Model. A finite difference form of Darcy's equation is used to compute moisture movement through the profile, which is considered to exist as a series of discrete layers. The soil properties used for each layer are considered to be the average for the entire layer and are applied at the center of the layer. A method to deal with soil inhomogeneity was formulated based on the moisture retention of the soil. The performance of the model was appraised by comparison of the results to field data and published analyses of these data. Figures were presented comparing evapotranspiration, deep seepage and root zone storage with these data. Profiles through the deep seepage region were used to evaluate the redistribution model. Predicted movement of the water table was compared to recorded values.

ntifiers: *Bullfrogs, *California, Competition,
og habitats, Predation, Rana-aurora, Rana-
lii, Rana-catesbeiana, San-Joaquin(Calif).

catesbeiana was introduced into California,
ween 1914 and 1920 and has since spread
ughout the state. In the San Joaquin Valley it
become the dominant frog on the valley floor
has spread into the Sierra Valley Nevada
thills. It is most abundant in the warm low
vation pools of the foothill streams, in areas
vily altered by man, although at least 2 popula-
s are established above 1600 m elevation. Of
2 frog species native to this region, R. aurora is
er absent or very rare at the present time,
le R. boylii is found mostly in small permanent
thill streams higher than 200 m elevation, in
s not occupied by R. catesbeiana. The disap-
rance of R. aurora from the region and the con-
ing reduction in range of R. boylii are at-
uted to habitat alteration coupled with preda-
and competition from R. catesbeiana.--Copy-

limentation, *Water storage, Water supply,
ll watersheds, Alpine.
tifiers: *Headwater reservoirs, Reservoir life,
ll reservoirs, *Siltation rates, *Alpine reser-
s.

objective was to determine the sedimentation
and life expectancies of small headwater
rvoirs in Montana. Thirty-five reservoirs were
en to sample in detail. Life expectancies are
generally 'infinite' (500 to several hundred
sand years) for alpine reservoirs, (2) generally
tens to a few thousands of years for montane
rvoirs, (3) several hundred years for subdued-
tane reservoirs, (4) one hundred to 2,000
s, for piedmont-foothills reservoirs, and (5) a
tens to one thousand years for plains reser-
. Siting of a small headwater reservoir in an
e area is more desirable than in the other
' watersheds studied. The reservoir basin
ly should lie in impermeable rocks (to avoid
erranean water loss) which will provide only a
gible amount of sediment when subjected to
action of the future reservoir. The watershed should be well-mantled with vegetation, particularly in areas immediately above the reservoir. Gentle topography is preferable to steep topography (erosion potential is lower); northeast aspect is preferable to southwest (for delay in snowmelt or chance of better quantities of vegetative cover); high elevations and/or being out of a rain shadow is preferable to low elevations or areas lying in rain shadows (to be in a zone of adequate precipitation for water to store in the reservoir and for plant growth).

Descriptors: *Sediment transport, *Sediment control, *Urbanization, *Maryland, Data collections, Projects, Construction, Engineering structures, Sediment yield, Correlation analysis, Land use, Rivers.
Identifiers: *Montgomery County(Md), *Anacostia River basin(Md).

Streamflow and sediment were monitored in an urbanizing drainage basin in southeastern Montgomery County, Md., from 1962 to 1972. During this period, urban construction areas averaged about 3 percent of the 21.1 sq mi basin. Urban land increased from 3.5 percent in 1959 to 20 percent in 1971. Virtually all the suspended sediment was transported during storms; three-fourths of it, during large storms. High sediment yields were observed in February, March, June, and August; and low yields generally from September through January. The decrease in sediment discharge in the latter half of the study period is attributed to a sediment-control program. Sediment discharge decreased 35 percent between 1967 and 1972, when effective control measures were installed on about half the construction sites. (Woodard-USGS)
W75-10141

**ESTIMATE OF SEDIMENT DISCHARGES, SANTA ANA RIVER AT SANTA ANA AND SANTA MARIA RIVER AT GUADALUPE, CALIFORNIA,**
Geological Survey, Menlo Park, Calif.
C. G. Kroll.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 412, $3.25 in paper copy, $2.25 in microfiche. Water-Resources Investigations 40-74, February 1975. 18 p, 5 fig, 9 tab, 4 ref.

Descriptors: *Sediment transport, *Sediment yield, *Sediment load, Rivers, California, Particle size, Bedload, Erosion, Beaches, Hydrologic data, Streamflow, Discharge(Water), Water temperature, Estimating.
Identifiers: *Santa Ana River(Calif), *Santa Maria River(Calif).

During the water years 1968-71 the mean daily suspended-sediment discharge of the Santa Ana River at Santa Ana, Calif., was 7,400 tons, and the mean daily coarse-sediment discharge was 3,400 tons. Extrapolated over the 31 water years (1941-71) of streamflow record, the mean daily values are 1,200 and 620 tons. In the Santa Maria River at Guadalupe, Calif., during the water years 1969-71, the mean daily suspended-sediment discharge was 8,700 tons and the mean daily coarse-sediment discharge was 5,500 tons. Extrapolated over the 31 water years (1941-71) of adjusted streamflow record, the mean daily values are 1,400 and 830 tons. The estimated long-term coarse-sediment discharge of the Santa Ana River is 620 tons per day or 190,000 cubic yards per year, and that of the Santa Maria River is 830 tons per day or 250,000 cubic yards per year. Only during flood-flow is any significant quantity of sediment transported. In the Santa Maria River an estimated 99 percent of all coarse sediment was transported in 1 percent (113 days) of the 31-year period. (Woodard-USGS)

**CARBON-14 AGES OF WATER FROM THE ARKANSAS HOT SPRINGS,**
Geological Survey, Reston, Va.
F. J. Pearson, Jr., M. S. Bedinger, and B. F. Jones.
Reprinted from the Proceedings of the 8th International Conference on Radio Carbon Dating, Wellington, New Zealand, October 1972, p D19-D30. 2 fig, 3 tab, 9 ref.

Descriptors: *Carbon radioisotopes, *Radioactive dating, *Hot springs, *Arkansas, Hydrogeology, Water chemistry, Geochemistry, Carbonates, Silica, Groundwater movement.

The Arkansas Hot Springs are on the southern margin of the Ozark Mountains, Arkansas, and have surface temperatures from 55 to 62 deg C. The adjusted C-14 age of the Hot Springs waters is 4600 years, while ages of up to 9000 years are found in cold spring waters in the Bigfork Chert. Variations in permeability along, and length of flow paths may explain these age differences. Recharge is through the Bigfork Chert, which is principally chalcedony but also contains carbonate beds and lenses. The flow paths to the springs pass through the Arkansas Novaculite and they emerge from the Hot Springs Sandstone, both carbonate-

free formations. The silica content of all the Hot Spring waters is 41-42 mg/litre, which is equivalent to chalcedony saturation at 63 deg C. The Hot Springs themselves and cold spring and well waters from the Bigfork Chert are calcium bicarbonate waters. The Hot Springs contain less calcium and bicarbonate but could be derived from cold Bigfork waters by precipitation of CaCO3 accompanying heating. Delta C-13 values of carbonate species dissolved in all waters range from -13 to -15 parts per thousand; those of the Hot Springs corresponding to Bigfork water to the northeast of the Springs. No carbonate isotope exchange has occurred because of lack of carbonate minerals in the area of heating or relatively rapid flow through fractures in the area of heating. (Knapp-USGS)

Nutrients, Dams, Energy budget, Water p
effects.
Identifiers: *Microecosystems, Ga
Bay(Texas), Trinity River(Texas).

This research was designed to predict the p
responses of Galveston Bay to freshwate
reduction which would increase freshwate
tion time, 15% of Houston Ship Channel e
entering continuously into the estuarine
waters, and simultaneous application o
stresses. Since these responses could not
vestigated directly, the effects of a sin
freshwater impoundment and simulated H
Ship Channel diversions into estuarine head
were investigated on a group of six conti
culture microecosystem simulations of Ga
Bay. The expected general responses of t
ecosystem to dam construction near the m
the Trinity River are increasing salinity, r
import and export of organic carbon, great
portion of nutrients bound in living form,
community metabolism from heterotrophy
autotrophy, reductions in both primary and
dary productivity, and reduction in the es
ecosystem's efficiency at converting in
energy into useful work and/or products.
taneous diversion of Houston Ship Chan
fluent to the headwaters of Galveston Bay
expected to be assimilated primarily in th
important nursery areas of the bay. Phytopl
and zooplankton species diversity through
estuary will be reduced; this effect will be m
tense in estuarine headwaters. (Jones-Wisco

**SEAGRASS ECOSYSTEMS. RECOMM
TIONS FOR RESEARCH PROGRAMS.**
Available from the National Technical In
tion Service, Springfield, Va 22161 as PB-2
$3.75 in paper copy, $2.25 in micr
Proceedings of the International Se
Workshop, October 22-26, 1973, Leide
Netherlands. 62 p.

Descriptors: *Marine plants, *
*Ecosystems, *Grasses, *Investigations, I
tional commissions, Information exchange
ferences.
Identifiers: *Seagrass, International Se
Workshop.

The International Seagrass Workshop wa
cerned about the lack of knowledge as to t
nificance of seagrass systems to coastal
ecology. Because of the worldwide shallow
distribution of seagrass ecosystems, their m
ment of marine species and fisheries, the
nerability to environmental perturbation, fi
ferent working groups proposed recommend
for research with background notes that to
constitute a framework for an interdiscip
program of study on these ecosystems. Re
ships between food and feeding habits are l
unknown but necessary for an understand
these communities. Although the impact of

atastrophies in oceans is intense, little is known bout cause and effect relationships or of practical neasures which would minimize them. Mechanisms by which seagrasses stabilize coastal ediments are not understood nor are the methods f recolonization or transplantation. Seagrass roductivity is among the highest in the world, but neasuring techniques are unavailable and the nechanisms that sustain the high productivity are nknown, nor is their global distribution. The effects of pollutants on these ecosystems are obcure. Recommendations for research areas and nethodology are discussed and the needs for interisciplinary and international cooperation. escriptors: *Marine plants, *Grasses, Ecosystems, *Measurement, *Productivity, race elements, Primary productivity, Biomass, ultures, Plant growth substances, Investigations, oasts, Oceans, Plant physiology, Benthic flora, utrients, Standing crops, Data collections, ooted aquatic plants, Sea water, Plant morpholoy, Climatic zones.
dentifiers: *Seagrass, International Seagrass Vorkshop.

he Physiology Working Group on seagrass roductivity discussed the problems of measuring e productivity of seagrass meadows and roposed guidelines and recommendations for reas of research. The complex ecology of primary roduction in a seagrass meadow includes the eagrasses, microepiphytic and macroepiphytic gae, benthic microalgae and macroalgae, and nytoplankton, but no single study has measured l these components of organic matter formation a seagrass meadow. The reported productivity or seagrass alone ranges between 10 and 20 g of arbon fixed/sq m/day, and with the addition of ther components of the ecosystem it would incate that seagrass meadows must be one of the ost productive systems on earth. The problem of imary production measurements in this cosystem are in obtaining good estimates on a reonal and global scale, and in the methodology for roductivity measurements on a physiological vel. Although the recommendations for producvity measurements do not include phytoplankn, nonetheless phytoplankton productivity ould be included in the total seagrass ecosystem easurements. Specific recommendations are ven for investigations of nutrients, trace metals, ant growth substances that may act as repellents grazers, environmental tolerance limits, orphology, laboratory culture, and species comsition in different geographic regions. (See also 75-10106) (Auen-Wisconsin)

entifiers: *Seagrass, International Seagrass orkshop.

Studies of detrital decomposition in sediments must be undertaken before mechanisms and importance of nutrient regeneration in sustaining primary production in seagrass ecosystems can be assessed. Flux of nitrogen and phosphorus between sediment and plants should be studied and techniques developed for separation, identification, and determination of nitrogen forms. Nature of microflora involved in metabolism, overall rates of release during metabolite decomposition from materials entering the sediment, fate of released dissolved organic compounds and organo-inorganic complexes, and loss of refractile molecules to permanent sediment should be studied by radioactive labeling of seagrasses. Anaerobic decomposition rates in particulate detritus should be determined in situ. Dissolved organic matter should be studied in relation to specific decompositional processes, rate processes of progressive degradation of dissolved organic components, bacterial succession of physiological degradation, indirect functional interactions of organic compounds with metals, and loss mechanisms as dissolved organic matter is degraded. Rate of physically dissolved organic matter loss from generation and degradation sites must be evaluated. Symbiotic relationships of epiphytic bacteria to angiosperm secretion of dissolved organic matter should be evaluated. Decomposer food chains are discussed. **CONSUMER ECOLOGY WORKING GROUP,**
Amakusa Marine Biological Lab., Tomioka (Japan).
T. Kikuchi, and J. M. Peres.
In: 'Seagrass Ecosystems. Recommendations for Research Programs,' Proceedings of the International Seagrass Workshop, October 22-26, 1973, Leiden, The Netherlands, p 41-45.

Descriptors: *Primary productivity, *Marine plants, *Energy transfer, *Grasses, Biological communities, Ecosystems, Shallow water, Habitats, Investigations, Food chains, Coasts, Balance of nature, Oceans.
Identifiers: *Seagrass, International Seagrass Workshop.

The task of the Consumer Ecology Working Group was to determine areas of research as to the fate of the total primary production of the faunal communities in seagrass systems and the potential pathways. The several research areas required are: (1) What taxa are to be studied, based on the requirements that functional units of taxa must be defined with special attention given to feeding methods, modes of life, and microhabitats of organisms. (2) The population dynamics of at least some dominant components of the ecosystem must be studied separately to evaluate the total population dynamics. (3) Analysis of the qualitative aspects of feeding, i.e., food preferences of communities and their modification by food availability or other conditions. (4) The amount of food consumed and assimilated should be based on physiological and autecological characteristics of consumers and evaluation of energy trophic levels via metabolites, secreted materials, carrion, and feces. (6) The non-energetic relationships among and also between trophic levels, e.g., shelter, competition, and toxic effects. A framework for research of these areas is given as well as investigative techniques. (See also W75-10106) (Auen-Wisconsin)

**OCEANOGRAPHY,**
Alaska Univ., College. Inst. of Marine Science.
D. C. Burrell.
In: 'Seagrass Ecosystems. Recommendations for Research Programs,' Proceedings of the International Seagrass Workshop, October 22-26, 1973, Leiden, The Netherlands, p 47-52.

Descriptors: *Marine plants, *Grasses, *Ecosystems, Investigations, Sedimentology, Shores, Environmental effects, Revegetation, Habitats, Nutrients, Latitudinal studies, Nutrient requirements, Coasts, Sediments, Oceans, Vegetation establishment, Trace elements, Pollutants, Shallow water, Water circulation, Plant physiology, Thermodynamic behavior, Physicochemical properties.
Identifiers: *Seagrass, International Seagrass Workshop.

The scope of investigations necessary to understand the ecology of seagrass is delineated. A major requirement is to understand why certain near-shore areas, especially territory adjacent to existing beds, do not support seagrass growth. The varying ability of specific geological environments to promote recolonization, and the rates at which this occurs, are particularly important for successful seagrass transplantation programs. There is a paucity of information for both the effects of severe storms or dredging operations on seagrasses and for their possible uses to decrease the impact of such events. Research areas on sedimentological conditions are described. The total cyclical behavior of the primary nutrients, nitrogen and phosphorus, should be studied. Special attention should be given to flux rates and the nature of intermediate nutrient species. The major and trace organic chemistry of various seagrass species should be characterized. Cycling of both physiologically and non-physiologically required trace metals should be studied and the effects of chemical pollutants investigated. The hydrodynamics associated with the colonization and maintenance of seagrass stands and the effect of seagrass beds on shallow water circulation patterns require investigation together with the environmental limits of seagrass meadows with respect to temperature, salinity, depth, etc. Recommendations are given for investigative approaches. North Carolina State Univ., Raleigh. Dept. of Zoology.
J. E. Hobbie, and B. J. Copeland.
Water Resources Institute Research Special, February 1973. 4 p, 1 fig, 7 ref. OWRT B-020-NC(3).

Descriptors: *Estuaries, *Estuarine environment, *Marine fisheries, *Rivers, *Water resources, Aquatic environment, Environment, Estuarine fisheries, Bays, Inlets(Waterways), Intertidal areas, Saline water-freshwater interfaces, Sea water, *North Carolina, Fish, Water sports, Natural resources, Projects, Nutrients, Nitrogen, Dams.
Identifiers: *Coastal water, Coastal zone management, Dam effects, Environmental policy, Nonpoint sources(Pollution), *Pamlico River estuary(NC).

Researchers have studied the Pamlico River Estuary since 1966; the area is a biologically rich estuary that serves as a nursery ground for many kinds of fish and shellfish. Although considerable algae is present, the water is clean enough for water sports and recreation. As eastern North Carolina experiences increases in population, industry and agriculture, the authors fear that the area will drastically change and that a valuable resource will be lost. After presenting a detailed description of the marine environment, the article suggests several modes for preserving existing conditions. First, it is suggested that nutrient input should remain constant and that circulation and runoff patterns remain unchanged. Second, the authors recommend that increased nutrient loading of nitrogen should be prevented, and finally, that the effects of dams be carefully studied before any action is taken. The article concludes that the risks of possible changes must be weighed against the benefits of maintaining the area's present status. (Fernandez-Florida)

**DESALTING PLANTS INVENTORY, REPORT NO. 5,**
Hawaii Univ., Honolulu. Coll. of Business Administration.
N. A. El-Ramly, and C. F. Congdon.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 556, $4.75 in paper copy, $2.25 in microfiche. Office of Water Research and Technology, March 1975. 80 p, 4 tab. 14-30-3286.

Descriptors: *Desalination plants, *Census, *Treatment facilities, *Distillation, *Membrane process, Freezing, Desalination processes, Water treatment, Waste water treatment, Water supply.
Identifiers: *Combined capacity(Desalting plants).

According to information received from desalting plant manufacturers, there are 1036 land-based desalting plants with capacities of at least 25,000 gallons-per-day in operation or being constructed throughout the world as of January 1, 1975. These plants are capable of producing about 526 million gallons of fresh water daily for cities and industries. Distillation processes are most widely used, accounting for about eighty-five percent of total capacity. The balance is almost entirely membrane processes with freezing accounting for less than one-tenth of one percent. During the three year period 1972-1974, since the previous Inventory Report was prepared, world-wide sales of desalting plants 25,000 gallons-per-day was reported as 408 plants with a combined capacity of 198 million gallons daily. Of these, 124 distillation plants with a combined capacity of 144 million gallons-per-day and 283 membrane plants with a combined capacity of 54 million gallons-per-day were reported. During the period only one freezing plant was reported. Plants retired from operation were deleted.

**MEANS FOR AND METHOD OF PURIFYING CONTAMINATED WATER,**
R. J. Campbell.
U S Patent No 3,885,399, 4 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 934, No 4, p 1379, May 27, 1975.

Descriptors: *Patents, *Water purification, Water quality control, Sea water, Brackish water, Flash freezing, *Desalinization, Crystallization, Separation techniques, Desalination apparatus, Waste water treatment.
Identifiers: *Freeze crystallization process.

An apparatus and method is described of purifying contaminated water by means of a two-step freeze crystallization process. The process avoids the problem of water freezing on the screen of the work column by reducing the temperature difference between the work water and the concentrate in the work column. The dilute concentrate from one stage is utilized as work water for the stage that contains concentrated concentrate. (Sinha-OEIS)

**REVERSE OSMOSIS SYSTEM WITH AUTOMATIC VALVE FOR MODULE OPERATION CONTROL,**
Desalination Systems, Inc., Escondido, Calif. (assignee)
D. T. Bray.
US Patent No 3,887,463, 5 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 935, No 1, p 293, June 3, 1975.

Descriptors: *Patents, *Reverse osmosis, *Semipermeable membranes, *Water quality control, Water storage, Water purification, Water treatment, Equipment, Valves, *Desalination.

The invention comprises a reverse osmosis system in which purified water from a semipermeable membrane-containing module is stored in a container under fluctuating, elevated pressure. Pressurized feed water flow into the module is shut off by an automatic valve when the pressure in the storage container rises above a first predetermined value, and flow is restored by the automatic valve when pressure is the storage container drops below a second and lower pressure caused by withdrawal of purified water for use. The restoration or turn-on pressure is a predetermined proportion of the feed water pressure and the shut-o pressure is related to or a proportion of the turn- pressure. The automatic valve has a body with first internal cavity; a central internal cavity of effective cross sectional area smaller than that of t first cavity; and a third internal cavity having opening leading to the central cavity of ar smaller than the central cavity. Movable seals sp the effective cross sectional areas of the first a central cavities. A third movable seal opens t third cavity to the central cavity. (Sinha-OEIS)

**FOG DISPERSAL - PHYSICAL AND TECHNOLOGICAL ASPECTS,**
Etablissement d'Etudes et de Recherches Meteorologiques, Paris (France).
L. Facy.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 3-11, 1974.

Descriptors: *Fog, *Weather modification, *Methodology, Airports, Meteorology, Technology, Silver iodide, Drops(Fluids), Crystals, Ice, Nucleation, Supercooling, Condensation, Chemicals, Aerosols, Propane.

dentifiers: *Fog dissipation, *Visibility improvement, Vaporization, Warm fogs, Cold fogs, Ice ogs, Collection efficiency, Helicopters, Freezing uclei.

og dispersal techniques were reviewed. These chniques were summarized as follows: (1) In old supercooled water fogs, use may be made of e thermodynamically metastable water phase by troducing natural or artifical ice or freezing uclei. (2)In warm fogs, sufficient heat may be pplied with burners to vaporize the droplets and provide an increase in air temperature for eater stability inside the clear space of air obined. (3)In warm (or even cold) fogs, a sufficient nount of hygroscopic chemicals may be spersed in order to lower the vapor pressure er the saturated droplets to make use of aoult's law versus the remaining pure water oplets. (4)The collection efficiency of the oplets may be increased either by mechanical d/or electrical means or by surface behavior odification. (5)The clear dry air above may be xed with the fog layer, if thin enough, by using ns or helicopters. (6)Ice fogs are the most difult case. In principle, heat or filtration are eoretically the only ways of dissipating the ice ystals. But heat must be provided by dry or diative devices in order not to inject additional ter vapor. **i A METHOD OF FOG MODIFICATION BY SSIVATION OF CONDENSATION NUCLEI,**
rainskii Nauchno-Issledovatelskii drometeorologicheskii Institut, Kiev (USSR).
A. Bakhanova, and A. V. Silayev.
Proceedings of the World Meteorological Organization/International Association of teorology and Atmospheric Physics Scientific nference on Weather Modification, October 1-1973, Tashkent (USSR). WMO No 399, Geneva vitzerland). p 13-17, 1974. 5 fig, 23 ref.

scriptors: *Fog, *Weather modification, ethodology, Nucleation, Condensation, oratory tests, Chemicals, Clouds, Adsorption, ohols, Ammonium compounds, Meteorology.
ntifiers: *Hygroscopic nuclei, Ammonium oride, Cetyl alcohol, Passivation.

e idea of artifical modification of the activity of cloud condensation nuclei with monolayers of ne surface-active agents (SAA) was developed viously. Some attempts have been made to ly the SAA to prevent fog formation but the ll number of these experiments and an amuity of their results do not permit any conclus about the efficiency of this method. The ef- of cetyl alcohol adsorption layers was studied the early stages of condensation growth of roscopic nuclei (ammonium chloride). The dification of the nucleus' surface by cetyl alol was carried out by the adsorption of its ecules from the gas phase. Nuclei growth was erved. The experiments showed that the initial e of condensation nuclei is of great importance the artificial reduction of their activity (the sod passivation). The laboratory and theoretical lts indicated that the method of passivation of condensation nuclei may be operationally ible in preventing fog formation. To apply this hod a reliable forecast of fog formation is ded. Another difficulty is to choose the cor- moment to introduce SAA vapor into the atphere. The quantity of SAA needed depends ly upon the air mass temperature; for exam- at 0C, 5.5 kg per cubic kilometer is needed; at the quantity needed is 10 kg; at 10C, 25 kg; and 0C, 160 kg. **IGN OF A MODERN THERMAL FOG DISATION SYSTEM FOR AIRPORTS,**
Force Cambridge Research Labs., Hanscom , Mass.
. Silverman, and A. I. Weinstein.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 19-28, 1974. 2 fig, 5 tab, 9 ref.

Descriptors: *Fog, *Weather modification, *Airports, Methodology, Design, Equipment, Technology, Heat, Fuels, Economics, Safety, Costs.
Identifiers: *Visibility improvement, *Warm fogs, Fog dissipation, Landing safety, Burners.

Cold fog accounts for only 5% of the total fog encountered on a worldwide basis, warm fog accounting for the other 95% of the cases. The direct application of heat from a well-engineered ground based system is the most practical and reliable technique for dissipating warm fog at airports where the volume of traffic justifies its installation. The U.S. Air Force has undertaken the development of a thermal fog dissipation system that is based on the application of modern meteorological and heat engineering technology. The design of this modern thermal fog dissipation system for airports was described. Operation of the thermal fog dispersal system will result in significant benefits in terms of improved operational effectiveness, improved cost effectiveness, improved operational safety, and net fuel economy. **PROBLEMS OF RADIATION FOG PREVENTION,**
Akademiya Nauk SSSR, Moscow. Institut Fizicheskoi Khimii.
B. V. Derjaguin, I. N. Grigorenko, V. A. Ershov, I. A. Zolotarev, and Yu. S. Kurgin.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 29-33, 1974.

Descriptors: *Fog, *Weather modification, *Methodology, Condensation, Nucleation, Mathematical studies, On-site investigations, Alcohols, Meteorology, Radiation.
Identifiers: *Passivation, Cetyl alcohol, USSR.

One possible method of affecting the formation of radiation fog consists of artificially reducing the condensation activity of nuclei by coating these with monolayers to reduce the vapor adsorption rate. In 1970-1971, experiments were carried out on a site located in the neighborhood of Barishevka, Kiev region. One group used as a chemical reagent a mixture of high-molecular alcohols of the Shebekinsk Chemical Combine, whose chemical composition included 95% of alcohols of C18-C22 fraction, whereas another group used cetyl alcohol. These experiments demonstrated the high efficiency of the passivation method involving the introduction of highly dispersed high-molecular alcohol into the atmosphere layer adjacent to the ground. In all cases thus treated, no formation of radiation fog was observed over the area having passivated condensation nuclei. (See also W75-09944) (Sims-ISWS)
W75-09948

**SOME DATA ABOUT THE MECHANISM OF THE ARTIFICIAL DISSIPATION OF SUPERCOOLED FOG,**
Central Aerological Observatory, Moscow (USSR).
L. I. Krasnovskaya, T. I. Shevaldina, and A. N. Hizhnjak.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tahkent (USSR). WMO No 399, Geneva (Switzerland, p 35-40, 1974. 4 fig, 8 ref.

Descriptors: *Fog, *Weather modification, *Aerosols, Laboratory tests, Nucleation, Propane, Temperature, Carbon dioxide.
Identifiers: *Cloud chamber studies, Fog dissipation, Freon.

Data have been published during the past 15 years concerning the possibility of using propane for the artificial dissipation of fog at temperatures considerably higher than the threshold temperatures at which cooling reagents and ice-forming aerosols are active. The values obtained in field experiments for the threshold temperature at which propane is effective suggest that the properties of the active nuclei formed by introducing agents of this type into fog are different from those of ice crystals. It therefore seemed useful to conduct laboratory investigations aimed at verifying this hypothesis. The experiments were conducted in a cooling chamber with a working volume of 16 cu m. Comparisons were made of the quantities of active nuclei formed per gram of reagent introduced with liquid carbon dioxide, propane, and Freon-12 in temperatures ranging from -10C to0C. Freon was chosen to represent reagents of the propane type; but it is much more convenient for experimental purposes because it is neither toxic not explosive. In the temperature range from -10C to -3C, there was practically no difference in the action time of the reagents tested; but above -3C there was a considerable difference. It can be assumed, therefore, that at such high temperatures, CO2 acts only as a cold source and that the active nuclei formed when it is introduced are ice crystals. (See also W75-09944) (Sims-ISWS)
W75-09949

**RAIN ENHANCEMENT - A REVIEW,**
Commonwealth Scientific and Industrial Research Organization, Epping (Australia). Div. of Cloud Physics.
J. Warner.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 43-50, 1974. 1 tab, 7 ref.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, Cloud physics, Rain, Precipitation(Atmospheric), Nucleation, Rainfall, Chemistry of precipitation, Silver iodide, Meteorology, On-site investigations, *Reviews.

Rain enhancement experiments in Australia, India, Israel, and the United States were reviewed. The good and bad features of these experiments were discussed. It was concluded that the following are necessary conditions for an experiment that will produce widely accepted results: (1) good statistical design and analysis of the experiment; (2) long-term continuity; (3) uniformity in cloud characteristics throughout the term of the experiment, or at least means of separating them; (4) a preponderance of clouds expected to be susceptible to the seeding technique employed; (5) sufficient background knowledge of the microphysics and dynamics of clouds in the area to enable the experimenter to accept or reject the statistical result. (See also W75-09944) (Sims-ISWS)
W75-09950

**RESULTS OF SEEDING CUMULONIMBUS CLOUDS AIMED AT THE MODIFICATION OF PRECIPITATION IN THE STEPPE PART OF THE UKRAINE,**
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
F. Ya., Voit, E. E. Kornienko, I. A. Kurejko, A. I. Furman, and S. B. Husid.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmopsheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 51-54, 1974. 1 tab, 12 ref.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, Cloud physics, Rainfall, Rain, Precipitation(Atmospheric), Silver iodide, Nucleation, Clouds, Meteorology.
Identifiers: *Cumulonimbus clouds, USSR(Ukraine).

Over a number of years, cumulus congestus clouds were seeded in the steppe part of the Ukraine in order to influence the amount of precipitation produced. As a result of randomized experiments during 1966-1968, it was found that seeding these clouds with dry ice resulted in a marked increase in precipitation from them, although the absolute increase in precipitation was not large. Seeding of cumulonimbus clouds began in 1972. Experiments were carried out over the experimental meteorological polygon of the Ukr-NIGMI (area 10,000 sq km). The cloud seeding was performed by means of an Australian-made generator of silver iodide installed in an IL-14 aircraft. Monitoring of the operation was by means of a network of raingages and a MRL-I radar of wavelength 3.2 cm. A cumulonimbus cloud or system of clouds was selected as an experimental unit. Aircraft took off on days when showers were forecast. A violently growing cloud or a group of closely spaced clouds with a small initial depth was chosen from the aircraft. Seeding took place at the cloud base, in the area of updraughts, and stopped when the cloud transformed into cumulonimbus and precipitation started. Positive results of seeding were indicated and the observed increase in precipitation was impressive. (See also W75-09944) (Sims-ISWS)
W75-09951

**SALT DRIZZLES EXTRACTED FROM UNSATURATED AIR LAYERS BY SEEDING WITH HYGROSCOPIC NUCLEI,**
Universite de Bretagne-Occidentale, Brest (France).
R. Serpolay, and M. Andro.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 55-61, 1974. 5 fig, 4 ref.

Descriptors: *Weather modification, *Artificial precipitation, *Drizzle, Atmopsheric physics, Fog, Salts, Nucleation, Sodium chloride, Precipitation(Atmospheric), Rainfall, Meteorology.
Identifiers: *Hygroscopic nuclei.

For studying the possibility of modifying fogs, an experimental ground-based device was proposed. It consists of a set of units, each of them being able to disperse suitably powdered hygroscopic material into the atmosphere. By thus dispersing a powder of NaCl, it has been possible to induce locally a drizzle in fog layers of depths between 40 and 60 m. The precipitation was observed very accurately at a distance less than 300 m leeward of the device, corresponding to a residence duration of about 4 minutes for the airborne particles. In order to increase the number of data resulting from field experiments, seedings were carried in uncloudy air layers whose relative humidity were between 100% and 75%, the latter value corresponding the the critical relative humidity for sodium chloride. All the seedings conducted in uncloudy conditions with relative humidity between 100% and 75% induced saline drizzles similar to those previously obtained by seeding the fog layers with the same ground-based device. In the case of drizzle droplets generated in moist air, it appears that the higher the relative humidity of the air in which the drizzle has been induced, the higher the percentage of the large-sized droplets. It appears that aerosols of hygroscopic particles are capable of inducing precipitation in clear as well as in cloudy conditions. (See also W75-09944) (Sims-ISWS)
W75-09952

**RAPID INDUCEMENT OF PRECIPITATION BY SEEDING STRATIFIED AIR LAYERS,**
Universite de Bretagne-Occidentale, Brest (France).
R. Serpolay, and M. Andro.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 63-67, 1974. 6 ref.

Descriptors: *Precipitation(Atmospheric), *Weather modification, *Cloud seeding, Meteorology, Artificial precipitation, Rainfall, Nucleation, Ice, Crystals, On-site investigations, Fog.
Identifiers: Hygroscopic seeding.

The medium-scale trials carried out at Brest-Guipavas Airport make use of the action of the hygroscopic particles on air layers where clouds are present or in which the humidity is close to saturation point. The results indicate that precipitation develops rapidly after seeding. With the speed of displacement of the air layers treated in this way, precipitation occurs at only a few hundred meters from the source of the nuclei. The size of the residual crystals which are left after evaporation of water from the precipitating saline droplets is, on the average, 4 to 10 times that of the nuclei used for seeding. In a series of experiments with super-cooled fogs seeded by using ice crystals produced in the spray of a refrigerating liquid, all the conditions seeming to prevail for a rapid formation of precipitation were listed. It was concluded that the following three conditions must be fulfilled: (1) temperature of the order of-4C or below; (2) high concentration of ice crystals equally competitive for the process of water vapor transfer and immediately available for this process on leaving the injecting device; (3) turbulent flow of the cloudy atmosphere, often occurring with a wind speed of at least 3 m/s or caused by eddies. The rapid growth of precipitation elements has often been attributed to the third condition only because it is observed regularly and systematically. (See also W75-09944) (Ochs-ISWS)
W75-09953

**ON THE EFFICIENT SIZE AND CONCENTRATION OF SPRAY DROPS FOR STIMULATING WARM CLOUDS,**
Japan Meteorological Agency, Tokyo. Aerological Observatory.
Y. Takahashi.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmopsheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 69-80, 1974. 5 fig, 9 ref.

Descriptors: *Precipitation(Atmospheric), *Weather modification, *Cloud seeding, Meteorology, Drizzle, Artificial precipitation, Rainfall, Nucleation, Drops(Fluids), Clouds.
Identifiers: Hygroscopic seeding.

Cloud droplets which have grown beyond a certain size by condensation in ascending air, and whose inertia of motion against the air have become significant will begin rapidly to grow to small drops or drizzle through mutual collisions due to turbulence, whether they are of equal size or not. Drizzle thus formed consists of drops of various sizes according to the number of collisions. Some grow to raindrops by capture of lots of cloud droplets before leaving the cloud. If the cloud is shallow and no signficant updraught exists, drizzle falls from the cloud. An equation for the probability of equal sized drops colliding in turbulence was presented and the radius at which cloud droplets may begin rapid growth by collision was found to be about 25 microns radius. The critical concentration of these drops was also determined to be at about 0.2 grams/per cu m. The time required to form drizzle was also discussed. Spray drops
enhancing precipitation in warm clouds sho
have a distribution of size close to or somew
larger than the critical size, say 25 microns
radius, and delivery of spray should preferably
where the mass concentration of big cl
droplets is approaching the critical value, say
or 0.25 grams per cu m. (See also W75-09

fects.

A new area of potential weather modificatio
mesoscale weather modification from solar ene
interception by small carbon particles--v
described. If a significant portion of the incom
solar energy over the oceans could be absorbed
the atmospheric boundary layer during
daylight hours, an artificial stimulation of cumu
convection would occur. This might be acco
plished by aerosol interception of solar radiati
It is envisaged that this mesoscale artificial h
source will be utilized to produce or intensify
mesoscale upward vertical motion field which v
stimulate extra cumulus convection. T
mesoscale heat source should produce or intens
the lower level mass and water vapor converge
fields. An enhancement of cumulus convecti
should follow. If tropospheric vertical wind she
are not too large, it is likely that this extra induc
cumulus convection will act as a 'feedba
mechanism to develop or intensity a mesosc
weather system or cloud cluster. This weat
system is likely to exist after the termination of t
extra solar heating. It may prove beneficial to e
ploy both the 'carbon dust' and the 'silver iodi
modification techniques. The carbon du
technique could be used to generate cumulus a
the 'silver iodide' technique at a later time
enhance the cumulus. (See also W75-09944) (Sim

, On-site investigations.
entifiers: *Israel.

e rain bearing, wintertime, subtropical cumuli
Israel are predominantly mixed clouds. Their
odel cloud-top temperature is -20C whereas
ud base temperatures are 9C, on the average.
nsequently, values of maximum liquid water
ntents in the upper parts of each of these clouds
re found to be normally in the range of 0.7-1.5
u m, depending on the size of the clouds. Ex-
sive measurements of icy crystal concentra-
ns in the vicinity of cloud tops indicate that
se concentrations correspond to the ice nuclei
ncentrations active at the same temperatures
d are thus clearly temperature dependent. The
ysical plausibility of the statistically significant,
sitive effects, that were obtained in both the
t and second Israeli cloud seeding experiments
s assessed. In the absence of an alternative rain-
ming process, normal ice crystal formation and
subsequent growth by accretion was shown to
capable of producing precipitation sized parti-
s in Cu clouds that have top temperatures
der than -12C (equivalent to a cloud 3.25 kg
p). The size and concentration of precipitation
ments in the various clouds are porportional to
depth of the clouds and their top temperature.
e computer values of the duration of precipita-
n and the time for its full development were in a
d agreement with the corresponding values ob-
ved by radar. Clouds, having top temperatures
rmer than -12C are unlikely to be affected by
ding with AgI particles having a threshold ac-
tion temperature of -5C. Cu clouds having top
peratures in the range of -12C to -20C seem to
mostly favorable to the type of seeding
cussed. (See also W75-09944) (Sims-ISWS)

ipitation, *Cloud seeding, Rainfall, Winter,
ipitation(Atmospheric), Nucleation, Clouds,
on dioxide, Cloud physics, Atmospheric
ics, Meteorology, On-site investigations.
tifiers: *Frontal clouds, USSR.

results obtained from seeding of frontal
ds in winter were discussed. Used as a re-
t, solid carbon dioxide was introduced from
irplane into layers suitable for seeding. Each
r's vertical thickness was not less than 250-300
hile the temperature did not exceed -4C. The
riment was performed so as to seed all the
ing cloud. The seeding line was fixed relative to the ground, so as to make the artificial precipitation occur within the experimental area. The results of 77 experiments were analyzed and can be divided into two kinds: (1) 61 events incorporating experiments with naturally precipitating frontal clouds; (2) 16 events where nonprecipitating frontal clouds of Sc, Ac, As types were seeded. The average relative increase in the experiments of the first group was 100%. Such a large increase in precipitation was attained because only a definite type of cloud with layers suitable for treatment was seeded. In the case of precipitating clouds, such layers were observed only in 42% of the events. Out of the 16 experiments of group 2, only in 8 events were the artificial precipitation areas obtained. The results show that treatment of frontal clouds by solid carbon dioxide causes a substantial transformation. It is characterized by a change of the phase state of drop and mixed layers, by an increase in crystal concentrations, and by raising of the temperature. This should cause dynamic disturbances, as well as a change in the precipitation amount. (See also W75-09944) (Sims-ISWS)

**GROUND-BASED CLOUD SEEDING EXPERIMENT AT DELHI DURING WINTER,**
Institute of Tropical Meteorology, Poona (India).
R. K. Kapoor, R. N. Chatterjee, K. K. Kanuga, S. K. Paul, and Bh. V. Murty.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 149-158, 1974. 1 fig, 5 tab, 12 ref.

Descriptors: *Weather modification, *Artificial precipitation, *Cloud seeding, Rainfall, Winter, Precipitation(Atmospheric), Nucleation, Silver iodide, Climatology, Meteorology, On-site investigations.
Identifiers: *Ground-based seeding, India.

A series of ground-based experiments, which relate to winter cloud seeding with silver iodide as a seeding agent, has been in progress at Delhi since 1968. The details of these experiments, which are to continue, and the results obtained so far were presented. The solution used for seeding, in the first 4 of the 5 seasons, was prepared by dissolving silver iodide in acetone with sodium iodide as solubilizer. It contained about 7% silver iodide by weight. The solution used in the fifth season contained ammonium iodide as solubilizer in place of sodium iodide. The period of experiment has been the four winter months, December to March. The seed-generator has been operated on each seeding day for about four hours during the hottest part of the day, i.e., between 1100 and 1600 IST. The rainfall in the target sector, on a seasonal scale, increased. However, the positive result obtained cannot be accepted as conclusive, unless the same trend continues to be shown by experiments in the next few seasons. (See also W75-09944) (Sims-ISWS)

Descriptors: *Weather modification, *Artificial precipitation, *Cloud seeding, *Mountains, Nucleation, Atmosphere, Silver iodide, Carbon dioxide, Precipitation(Atmospheric), Model studies, Mathematical models, Atmospheric physics, Cloud physics, Meteorology, Theoretical analysis, On-site investigations, Washington.
Identifiers: Cascade project, Cascade Mountains(Wash).

In 1969 the Cloud Physics Group at the University of Washington commenced a program of research to investigate the dynamics and microstructure of winter storms over the Cascade Mountains. The program involves extensive measurements both on the ground and in the air, the development of a theoretical model to describe the airflow over the Cascades and the growth and fallout of precipitation, and investigations into the effects on the microstructure of the clouds and on precipitation at the ground of introducing artificial ice nuclei directly into clouds with particular emphasis on diverting snowfall from the western slopes of the Cascades to the drier eastern slopes. An outline was given of the theoretical basis of the project and the experimental techniques that are being used in the field studies. Emphasis was place on observations and measurements obtained when artificial seeding was carried out and on current conclusions concerning the effectiveness of this technique for modifying the distribution of snowfall across a mountain range. **SEEDING REQUIREMENTS FOR RAPID GLACIATION OR STIMULATION OF A MIXED PHASE CLOUD,**
State Univ. of New York, Albany. Atmospheric Sciences Research Center.
J. E. Jiusto.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 169-178, 1974. 4 fig, 4 tab, 13 ref.

Descriptors: *Weather modification, *Artificial precipitation, *Mathematical models, Model studies, Cloud physics, Atmospheric physics, Nucleation, Cloud seeding, Crystals, Ice, Supersaturation, Glaciation, Meteorology.

Frequently, there are not enough ice nuclei present for partial or complete glaciation of supercooled clouds. This is especially true of highly convective systems where the supply rate of water vapor can exceed the extraction rate by deposition onto available ice crystals. There is a critical concentration of ice crystals beyond which a cloud will glaciate. This concentration, which varies with cloud updraft strengh, temperature, and crystal size and type is important in the development of natural and seeded clouds. An equation was previously developed to estimate the number of nuclei necessary to rapidly glaciate a supercooled cloud. With more complete information on crystal growth rates now available, it is possible to refine these estimates for particular crystal types and for several pressure levels. The basic equation employed was that for supersaturation change with time in a mixed-phase cloud. Supersaturation in an all-water warm cloud has been expressed by several other investigators. This expression was extended to include the ice phase and to consider supersaturation with respect to ice. Some results of calculations using this equation were presented. Implications of these results as they relate to the concentrations of nuclei needed in cloud modification were listed. (See also W75-09944) (Sims-ISWS)

**THE PYRAMID PILOT CLOUD-SEEDING PROJECT,**
Nevada Univ., Reno. Desert Research Inst.
J. A. Warburton.

In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 179-186, 1974. 2 fig.

Descriptors: *Weather modification, *Cloud seeding, *Artificial precipitation, *Snowfall, Silver iodide, Nucleation, Precipitation(Atmospheric), Mountains, Radar, Water supply, Projects, Meteorology, Nevada.
Identifiers: Sierra Nevada, Pyramid Lake Pilot Cloud-Seeding Project, Reno(Nev.).

In early 1970, a serious water shortage and water rights problem emerged in western Nevada. The surface elevation of Pyramid Lake, an ancient desert lake, was observed to have fallen some 20 meters over a period of 60-70 years. Increased water usage, irrigation, and urban development had presumably contributed significantly to this drop in lake level. Concern for the preservation of the lake, site of an Indian reservation, on both environmental and economic grounds led to the commencement of the Pyramid Pilot Cloud-Seeding Project, a weather modification program designed to augment the inflow to the river system supplying water to the lake and the surrounding urban areas. The project area is being seeded with six ground-based AgI generators. A 3.2 cm lambda weather radar is being used for observations of the winter snowstorms. With the radar data in digital form, a great variety of analysis can be performed. The combination of rugged terrain and the need for the seeding material to flow over the Sierra crest line into the target area lying on the east down-slope side of the mountains provided a situation where it was important to measure the silver content of the precipitation falling in the project area. Observed concentrations of silver in the target precipitation are typically 4 to 10 times 'background.' (See also W75-09944) (Sims-ISWS)

Gidrometeorologicheskii Institut, Leningrad (USSR). High-Altitude Geophysics Inst.
I. I. Burtsev, I. I. Gaivoronsky, and A. I. Kartsivadze.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 189-196, 1974. 1 tab.

Descriptors: *Weather modification, *Cloud seeding, *Model studies, *Hail, Storms, Cloud physics, Atmospheric physics, Mathematical models, Nucleation, Crystals, Precipitation(Atmospheric), Meteorology.
Identifiers: *USSR.

In the past decade much success has been gained in the studies on hail formation and hail precipitation processes. As a result of these studies the possibilities of influencing the hail forming process have been learned. These studies were reviewed with particular emphasis given to the model studies of hailstorms in the USSR and elsewhere. The operational techniques used in the hail suppression activity in the USSR were described, and the results of these activities were summarized. Analysis of the results of hail suppression over 5 years shows a decrease by a factor of 3-4 both in relation to control areas and in comparison with many years' data obtained before protection. On the other hand, crops over wide areas are still damaged by hail. Analysis of the experience obtained in hail suppression work shows that the most considerable damage occurs during years of intensive hail processes or when hail clouds were not seeded or were seeded insufficiently. Efficiency evaluation both in the USSR and in other countries requires further improvement and verification. Statistical methods and randomized experiments will result in more objectiveness as far as hail suppression evaluation is concerned. More and more attention is being given in the USSR, USA, France, Canada, and other countries to these problems. It would be more justifialbe to carry out investigations and operational work cooperatively on the basis of the results already obtained. (See also W75-09944) (Sims-ISWS)

**HAILSTORMS IN JAPAN,**
National Research Center for Disaster Prevention, Tokyo (Japan).
Y. Omoto.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 207-215, 1974. 9 fig, 1 tab, 11 ref.

Descriptors: *Hail, *Weather modification, *Climatology, Cloud physics, Storms, Cloud seeding, Precipitation(Atmospheric), Meteorology.
Identifiers: *Japan.

An essential part of a hail suppression research project is to obtain knowledge on the characteristics of hailstorms which occur in the area under consideration. In Japan, there had been relatively few studies on hail, especially before the mid-1960s. Between 1965 and 1969 the central and east-central portions of the main island, Honshu, suffered an unusually great amount of damage by hail. At about this time, the National Research Center for Disaster Prevention was planning to promote weather modification research in Japan, and the organization decided to choose hail suppression as object of the first field program. The main task of the project was the development of a suitable seeding rocket for use over land areas of Japan. Efforts to obtain basic meteorological knowledge on hailstorms had to be carried out simultaneously. Recent research results on various aspects of hailstorms in Japan were summarized. Considering the operational aspects of such a project and the climatology of hail-affected regions of Japan, operations using anti-aircraft guns or rockets from the ground seem unpractical in Japan. Seeding by rockets launched from aircraft or pyrotechnic devices dropped from aircraft seems to be a more practical approach. Methods of seeding from aircraft flying under the storm cloud base are inadequate in Japan because cloud bases are relatively low over the mountainous regions. Further studies on hailstorms are required in order to make a conclusive decision on the feasibility of an operational hail suppression program in Japan. (See also W75-09944) (Sims-ISWS)

Descriptors: *Weather modification, *H *Cloud seeding, Sodium chloride, Silver iod Methodology, Cloud physics, Agriculture, Cr Meteorology, On-site investigations.
Identifiers: *Hail suppression, USSR.

The Transcaucasian Hydrometeorolog Research Institute (THRI) developed and us method of active modification of hail proce which differs substantially in its principles f methods used by other investigators in the US The method is based on the simultaneous appl tion of hygroscopic and crystallizing reagents. crystallizing reagents are used in comparati small quantities, since the principal modifica effects are achieved by the seeding of hygrosc reagents into the warm part of the cloud. Sod chloride particles are injected by means of hail shells near the base of the cloud and at mean level of the zone of increased radar ref tivity as hygroscopic reagent, and silver iodid introduced into the supercooled part of the cl in the zone of maximum radar reflectivity crystallizing reagent. Results were presented measures taken to protect agricultural crops large areas from hail during 1969-1973. Specia tention was drawn to 1972 when, despite the ceptional intensity and duration of potential producing processes, protection was success In 1972, within the protected area, hail-damag crops over an area of only 91 ha was record while in the control area over 7979 ha suffe damage. It was determined that the hail-dam within the protected area was caused by a dela starting operations. The effect of the protec measured by the THRI method was demonstra by comparing the proportion of crops damage the protected and the control areas. Over the years, crops in the protected area were dama by hail to an extent amounting only to 2.4% those damaged in the control area. (See also W 09944) (Sims-ISWS)

In: Proceedings of the World Meteorological ganization/International Association Meteorology and Atmospheric Physics Scient Conference on Weather Modification, Octobe 7, 1973, Tashkent (USSR). WMO No 399, Gen (Switzerland), p 239-241, 1974.

Descriptors: *Weather modification, *H *Cloud seeding, *Programs, Precip tion(Atmospheric), Projects, Methodology, Ar cial precipitation, Meteorology.
Identifiers: *Hail suppression, *Bulgaria.

Cooperational activities aimed at reducing eliminating hail were initiated in 1968. Bulga

cialists, assisted by Georgian collegues, pared a program and proposed an organiza- al structure to deal with hail suppression. Ex- mental seeding began at the end of the 1969 season and was over an area of 3000 sq km. In- igations had to be made concerning the part of convective cloud where the hail-forming cess is expected to occur, and the way that this be identified by radar. A relationship was ght between the thermodynamic factors of the sophere, the underlying surface and the ction of movement of the cloud. It was found for optimum results the part of the cloud to be ed is that where the temperature is about - This corresponds to a level where the tem- ture outside the cloud is -6.3C. At present in aria, four polygons having a total area of more 6000 sq km are protected; one of them is still e experimental phase and another is being or- zed for operation during the next season. The ee of success achieved in each polygon is dif- nt depending on wheather the Georgian ods were strictly applied, how thoroughly the peculiarities were studied, and how high the of training of the personnel had been. In two e polygons where well-trained specialists are ork, having a combined protected area of than 3000 sq km, damage by hail has eased about sixfold. A side effect of the hail ression projects is an apparent increase in the nt of precipitation by 8%. (See also W75- ) (Sims-ISWS)

**RESULTS OF EXPERIMENTAL AND OPERATIONAL WORK ON COMBATING FOREST FIRES,**
Gidrometeorologicheskii Nauchno-Issledovatelskii Tsentr, Leningrad (USSR).
E. S. Artsybashev, P. A. Gubin, A. I, Sidorov, Ju. P. Sumin, and N. S. Shishkin.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 265-266, 1974. 4 ref.

Descriptors: *Weather modification, *Forest fires, *Cloud seeding, On-site investigations, Rainfall, Precipitation(Atmospheric), Artificial precipitation, Silver iodide, Nucleation, Meteorology.
Identifiers: USSR.

Studies of the possibility of rainfall redistribution in regions of forest fires were begun in 1968 at the Main Geophysical Observatory and the Forest Economy Institute of Leningrad. The extinguishing of forest fires by artificial precipitation is an example of practical application of weather transformation methods. Four air groups attempted to extinguish 280 forest fires in 1970-1972 by this new method. Seeding locations were chosen based on the speed and direction of movement of the clouds so that induced rainfall will occur over the fire some 10-15 minutes later. An ice-forming agent was introduced into the cloud with help of pyrotechnical cartridges of 26 mm caliber containing 16 g AgI or PbI2. Induced precipitation fell on 214 fires (77%), of which 121 fires (43%) were extinguished by it. Their total area was 177,000 hectares. Statistics on the areas of fires extinguished by induced precipitation compared with the areas where conventional firefighting methods were used permit the conclusion that extinguishing forest fires over an area of 120,000 hectares in 1970-1971 prevented their spreading and preserved the forest at the area of 220,000 hectares. Investigations are currently being pursued to improve this new method. (See also W75-09944) (Sims-ISWS)

**CONVECTIVE CLOUD MODIFICATION TO REDUCE THUNDERSTORM ACTIVITY,**
Central Aerological Observatory, Moscow (USSR).
I. I. Gaivoronsky, L. P. Zatsepina, and B. I. Zimin.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 267-274, 1974. 6 fig, 3 tab, 4 ref.

Descriptors: *Weather modification, *Thunderstorms, *Lightning, *Cloud seeding, Storms, Cloud physics, Precipitation(Atmospheric), Radar, Instrumentation, On-site investigations, Meteorology.
Identifiers: Lightning suppression, USSR(Moldavia).

In summer 1972 a randomized modification experiment on thunderstorms was begun in Moldavia. Thunderstorm clouds with tops from 9 to 12 km were seeded by means of antihail rockets. Between 9 and 12 kg of PbI2 was introduced into the cloud between isotherms -6 and -20C. To assess the seeding results, lightning frequencies in 6 seeded clouds (before and after seeding) and 5 control clouds were compared. The mean lightning frequency in control clouds was 3.8 and in seeded clouds before seeding was 4.0 discharges per minute. The lightning frequency was reduced in all cases after seeding. The average reduction was equal to a factor of 2.4-2.5 compared with the control clouds or the seeded clouds prior to seeding. On the same proving ground in Moldavia in 1972 the randomized modification experiment on convective clouds with the help of large antihail rockets carrying powders was begun. Experiments carried out earlier had confirmed the possibility of destroying convective clouds by including descending currents through roughly dispersed powders released into the upper region of a cloud from an aircraft. Results of these experiments confirmed the feasibility of the rocket method to regulate the evolution of convective clouds with a thickness equal to 4.7 km. (See also W75-09944) (Sims-ISWS)

**THE EFFECT OF CHAFF SEEDING ON LIGHTNING AND ELECTRIC FIELDS OF THUNDERSTORMS,**
National Oceanic and Atmospheric Administration, Boulder, Colo. Atmospheric Physics and Chemistry Lab.
H. W. Kasemir.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973., Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 289-294, 1974. 3 fig, 7 ref.

Descriptors: *Weather modification, *Thunderstorms, *Lightning, *Electrical coronas, Electricity, Cloud physics, Atmosphere, Atmospheric physics, Cloud seeding, On-site investigations, Meteorology, Electric fields.
Identifiers: *Lightning suppression, Chaff seeding, Corona discharge, Electric charge.

Corona discharge appears at the ends of a chaff fiber in an electric field of 30 kv/m or more. If a pound of chaff consisting of about 2 million fibers is released from an airplane in a thunderstorm field of about 60 kv/m, a corona current of about 1 microampere is generated at the ends of each fiber. The net current of the 2 million fibers adds up to about 2 ampere and the charge released into the cloud in 100 seconds would be of the order of 200 coulomb. The net current and the net charge are comparable to the values of an average thunderstorm and will tend to neutralize the thunderstorm field. The application of this concept to modifying lightning or thunderstorm fields has two main difficulties: (1) the distribution of chaff fibers in the high field areas of the cloud must be fast enough to be effective in a large cloud volume, and (2) the possibility that ions liberated by corona discharge are trapped by the cloud droplets in the immediate neighborhood of the individual chaff fiber. This could generate a concentrated space charge around the fiber, which may quench the corona discharge before a large amount of charge is released. To investigate these problems, field experiments have been planned. After preliminary tests in Flagstaff, Arizona, the first of these experiments was carried out in

Boulder, Colorado, in 1972. The results indicate that the decay of the electric field under a thunderstorm is accelerated by about a factor five by chaff seeding as compared with the natural decay of the field of a nonseeded storm. Instrument development, test procedures, data analysis, and the significance of this field decay experiment to lightning modification were discussed. (See also W75-09944) (Sims-ISWS)

In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 301-308, 1974. 4 fig, 3 tab, 5 ref.

Descriptors: *Weather modification, *Aersolos, *Clouds, Laboratory tests, Laboratory equipment, Convection, Cloud seeding, Cloud physics, Atmospheric physics, Meteorology, Particle size, Particle shape.
Identifiers: Powder, *Downdrafts, Cloud destruction.

Experiments on the destruction of convective clouds by a system of coarse aerosol particles were conducted. An initial impulse of downdraft velocity is generated by releasing a high concentration system of coarse aerosol particles at the top of a developing convective cloud. The descent velocities increase with increasing mass and reach several meters per second which is 1.5-2 orders of magnitude greater than the descent velocity of an isolated particle of the same material. In unstable conditions, the down-draft will be propagated after having been given the initial impulse and this will result in convective cloud destruction. Theoretical calculations and analysis of a great number of experiments together with the results of the experiments prove the possibility of using this technique for destroying convective clouds. **THE EML 1973 FLORIDA AREA CUMULUS EXPERIMENT,**
National Oceanic and Atmospheric Administration, Coral Gables, Fla. Experimental Meteorology Lab.
R. I. Sax, J. Simpson, and W. L. Woodley.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 309-316, 1974. 1 fig, 1 tab, 5 ref.

Descriptors: *Weather modification, *Artificial precipitation, *Cloud seeding, Cloud physics, Clouds, Model studies, Rainfall, Radar, Precipitation(Atmospheric), Silver iodide, Nucleation, Convection, *Florida, Meteorology.
Identifiers: Tropical cumulus clouds.

The 1973 Florida Area Cumulus Experiment (FACE) of NOAA's Experimental Meteorology Laboratory (EML) is the latest in a ten-year series of statistically controlled experiments to evaluate the effects of dynamic seeding on tropical cumulus clouds. Dynamic seeding of super-cooled convective clouds is based on the hypothesis that massive seeding with artificial ice nuclei can, under specifiable and predefinable conditions, cause enhance cloud growth had lifetimes, leading to increased precipitation in some situations. The experiments began on isolated cumulus clouds and have been guided by a one-dimensional numerical simulation of precipitating cumulus towers. By 1969, it had been demonstrated that with 26 pairs of single-clouds, the radar-deduced total rainfall from the seeded cumuli was about a factor of three more than from the controls with a significance at the 5% level using several statistical tests. In 1970, EML progressed from single cloud experiments to cloud group seeding in a 10,000 sq km (later increased to 12,000 sq km) target area, to determine whether dynamic seeding could promote 'cumulus mergers' and possibly increase the net rainfall over a large area. Randomization in the area experiment was by day. Both 'floating' and total target rainfalls were evaluated with calibrated S-band radars. At the present time, the best estimate of the 'floating target' rainfall increase is comparable to that for single clouds, (i.e., a factor of three) but only at the 10% significance level. **TECHNICAL DEVICES FOR THE ARTIFICIAL MODIFICATION OF CLOUD AND FOG,**
Central Aerological Observatory, Moscow (USSR).
I. I. Gaivoronsky, Yu. A. Seregin, A. I. Sidorov, and S. A. Silin.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 319-324, 1974.

Descriptors: *Weather modification, *Equipment, *Cloud seeding, Artificial precipitation, Silver iodide, Carbon dioxide, Aerosols, Engineering, Precipitation(Atmospheric), Meteorology.
Identifiers: *USSR, Airborne equipment, Ground-based equipment, Pyrotechnic devices, Rockets.

Investigations showed that seeding from an airplane into the upper surface of the cloud with dry ice in dust form was less effective than seeding with particles of 0.3-0.5 cm. Two types of equipment for disseminating CO2 from aircraft were developed. One of these is based on the transformation of liquid CO2 into solid onboard the aircraft itself. A device was developed which converts solid CO2 from standard solid blocks into granules of between 0.2 and 1 cm, with a prevailing size of 0.3-0.6 cm and not more than 10% of dust. A list was made of the most effective pyrotechnic compounds for the volatilization of silver iodide and lead iodide. Suitable devices were designed for ensuring the steady and reliable burning of the pyrotechnics when fired at great heights from aircraft or from ground installations. A special aerosol container for dropping from aircraft, with a capacity of about 30 g of powder, was developed for seeding clouds with cuprous sulphide and other dusts. A rapidly developing aspect of the problem of weather modification is the stimulation of downdrafts in unstable air by the artificial generation of a downward movement by seeding the clouds with coarse-grained aerosol. A special remote-controlled installation was designed to ensure that, despite the high speed at which the aircraft is moving, the aerosol is released in a compact cloud and dispersed in the form of a trail. The series of ground-based and airborne devices for active intervention on clouds now render possible a wide range of experimental work. (See also W75-09944) (Sims-ISWS)

**ENGINEERING AND OPERATIONAL ASPEC OF WEATHER MODIFICATION,**
South Dakota School of Mines and Technolo Rapid City. Inst. of Atmospheric Sciences.
A. S. Dennis, and R. A. Schleusener.
In: Proceedings of the World Meteorological ganization/International Association Meteorology and Atmospheric Physics Scient Conference on Weather Modification, Octobe 7, 1973, Tashkent (USSR). WMO No 399, Gen (Switzerland), p 325-332, 1974. 2 tab.

Descriptors: *Weather modification, *Rainf *Hail, *South Dakota, Cloud seeding, Sil iodide, Nucleation, Precipitation(Atmospher Artifical precipitation, Projects, Meteorolo Agriculture.
Identifiers: *Seeding techniques, Hail supp sion.

Various seeding concepts and delivery techniq were reviewed as a back-ground to the So Dakota cloud seeding program which designed to increase rainfall and suppress h Because of the variety of crops grown in So Dakota and wide variations in crop and moisture conditions, it was decided that the gram should be under local control. Each of th county governments decides annually whether county will participate in the program during following year and also chooses the periods w seeding will be done. The decision that seed would be concentrated on convective clouds, curring either in isolation or in squall lines, le the choice of updraft seeding from airbo generators as the delivery technique. Aceto generators carrying a solution of silver iodide ammonium iodide in acetone were selected as basic seeding technique. The program started 1972 with a 4% solution by weight, but in 197 2% solution was used. In hail suppression si tions, the generators were supplemented by burning for as short as 30 seconds of flares c taining up to several hundred grams of sil iodide each. As this program was not randomiz some commonly used evaluation techniques not applicable. Although there were a l number of hail threats resulting in deploymen aircraft for seeding, hail damage to crops thro mid-August totaled approximately $10,000,0 about one-third of the long-term average. Des the lack of an accurate evaluation of the res obtained so far, the South Dakota program is garded favorably by approximately 75% of people in the state according to a survey in 1972. Identifiers: *Japan, *Rockets, Hail suppression, Pyrotechnic devices.

A 5-year hail suppression research project in Japan ended in 1972. A rocket system was used for seeding. It was shown that dispersion of artificial nuclei with high concentration into the appropriate part of hail producing clouds is the most effective method of hail suppression. Since it was not possible to use aircraft or antiaircraft guns for the experiment, a method using rockets launched from the ground was chosen. Disintegration of seeding rockets by using explosive compounds had been used for hail suppression experiments in all foreign projects known of at the time. However, it was recognized that such a system over public land would be extremely difficult in Japan. Consequently, a method was developed by which the rocket body would completely burn away in the air after seeding. After 2 years of development, the NRCDP-1 rocket was completed. The NRCDP-1 rocket exhibited generally satisfactory performance in regard to flight, dissipation, and seeding. However, it is desirable to carry out more seeding experiments with a larger number of rockets in order to obtain more data concerning seeding effects, especially in the case of convective clouds. For this purpose, however, some improvement of the rocket system is desirable. (See also W75-09944) (Sims-ISWS)

**A REVIEW OF METHODS TO EVALUATE PRECIPITATION MODIFICATION IN NORTH AMERICA,**
Illinois State Water Survey, Urbana. Atmospheric Sciences Section.
S. A. Changnon, Jr.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No 399, Geneva (Switzerland), p 397-422, 1974. 4 fig, 7 tab, 20 ref. Dept. of Int. Contract 14-06-D-7197 NSF Grants GI-33371, GI-38317, GK-37859.

Descriptors: *Weather modification, *Evaluation, *Methodology, *North America, Cloud seeding, Projects, Rainfall, Snowfall, Hail, On-site data collections, Model studies, Stochastic processes, Statistical methods, Variability, Sampling, Meteorology, Reviews.
Identifiers: Randomization, Target-control methods, Cross-over methods, Continuous-historical methods.

The history of evaluation methods used in weather modification was reviesed. Selected examples of the natural variability of rain and hail were described and it was shown how variability complicated evaluation of rain and hail modification. Various evaluation methods were discussed that have been used in rainfall, snowfall, and hail modification projects. Means of collecting surface data to evaluate rain and hail experiments were evaluted and their limitations and values were indicated. It was concluded that the many North American projects, both commercial and government supported, of the least 25 years have provided a wealth of conflicting results attributable to a variety of causes, and have often employed inadequate and confusing evaluation methodologies. **METHODS OF ESTIMATING PHYSICAL AND ECONOMIC EFFECTIVENESS OF WEATHER MODIFICATION,**
Ukrainskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Kiev (USSR).
M. V. Bujkov, and E. E. Kornienko.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 423-430, 1974. 3 tab, 2 ref.

Descriptors: *Weather modification, *Evaluation, *Artificial precipitation, *Hail, Cloud seeding, Economics, Benefits, Precipitation(Atmospheric), Model studies, Cloud physics, Nucleation, Meteorology.
Identifiers: *USSR, Hail suppression.

The numerical simulation of clouds may help control the results of weather modification experiments; but in order to exclude atmospheric turbulence, it is necessary to make calculations with the space increments equal to 0.1 cm and the time increments equal to 0.1 sec. Information about the physical processes in clouds may make easier the classification of natural situations, permit selection of more homogeneous samples, produce statistically significant results with smaller numbers of experimental units, and give qualitative evidence of the artificial changes of cloud state. Four long-duration experiments on precipitation augmentation were carried out in the USSR. The results of these experiments were re-evaluated with consideration given to the economic effectiveness of the experiments. The value of the additional crops produced because of the precipitation increase and the expenses to carry out the cloud seeding were considered. Calculations taken into account only one crop and the cloud seeding during two arbitrarily chosen vegetation periods. A formula was derived for the direct estimation of the profit and the profit rate and may be used for the optimal design of a cloud-seeding experiment. A review was made of the methods of evaluation applied in the antihail operations in the USSR. These methods do not take into account that after inspection of hail damage, farm workers may compensate for some of the damage by devoting additional work. A very dissappointing shortcoming of the methods reviewed was the complete lack of statistical evaluation of the results of antihail operations. (See also W75-09944) (Sims-ISWS)

Descriptors: *Weather modification, Effects, *Cloud seeding, *Artificial precipitation, Rainfall, Clouds, Precipitation(Atmospheric), Nucleation, Cloud physics, Statistical methods, Meteorology, *Evaluation.
Identifiers: *Extended area effects, Downwind effects.

Weather modification programs involving the release of seeding material for augmenting precipitation or for reducing storm damage are in progress in the United States and other countries. There is increasing evidence that the effects of some of these experiments or operations may extend over a considerably broader geographic area than that for which they are intended. Although the evidence is not conclusive, a number of questions have caused an increasing concern among both scientists and administrators. Initially, the concern about extended area effects was limited to speculations about the possibility of adverse 'rainshadow' effects in areas downwind of precipitation augmentation projects. However, preliminary analyses by several investigators suggested that positive rather than negative anomalies had occurred downwind of the intended target in a number of projects. Several processes, or mechanisms, may reasonably produce such effects. These include processes that primarily involve (1) atmospheric transport followed by microphysical effects, (2) dynamic effects, and (3) transport processes combined with dynamic effects. The research in progress at Colorado State University on the reality and processes of downwind effects from cloud seeding activities was described. Recent analyses indicate that increases in the target area were not at the expense of downwind precipitation. The likelihood that the precipitation in the extended area was enhanced as a result of the seeding is high, but not conclusive. (See also W75-09944) (Sims-ISWS)

Descriptors: *Weather modification, *Hail, *Economics, *Evaluation, Cloud seeding, Statistical methods, Benefits, Precipitation(Atmospheric), Correlation analysis, Meteorology.
Identifiers: *USSR, *Target-control evaluation, Hail suppression.

While analyzing antihail activities, it is necessary to conceive all possible after-effects, both expected and accidental, to determine if they are due to weather modification or to some other factors, and to evaluate the accuracy of the estimates made. It is important to consider two effects: (1) the physical effect of hail-suppression efforts irrespective of the expenses made and crops protected, (2) the economic effect of hail-suppression projects when crops, progress in hail modification, and all the expenses are considered. Modification effect estimation from the reduction of the equivalent crop hail damage area is more objective than the absolute crop hail damage area; although these are not physical efficiency estimations because they indirectly depend on the protected object parameters, the total crop areas, and the crops used. To test the calculation accuracy of the relative economic efficiency by the target-control approach, a statistical experiment was staged. The target-control approach is characterized by a large estimation error in economic efficiency. Precise definition of suppressed hailfall parameters decreases the error approximately up to 25%. The accuracy might be even higher if the suppressed hailfalls could have been localized. (See also W75-09944) (Sims-ISWS)

**PREPARATION AND PROPERTIES OF 'PURE' SILVER IODIDE AEROSOL,**
Centre National de la Rechereche Scientifigue, Bellevue (France). Laboratoire de Meteorologie Dynamigue.
M. M. Poc, and M. Roulleau.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR), WMO No 399, Geneva (Switzerland), p 485-498, 1974. 9 fig, 5 ref.

Descriptors: *Silver iodide, *Aerosols, *Laboratory equipment, *Nucleation, Ice, Chemistry, Laboratory tests, Methodology, Equipment, Cloud seeding, Weather modification.
Identifiers: *Ice nuclei.

Although silver iodide has been used for many years in weather modification experiments, the basic mechanisms by which it acts as an ice nucleant are not well known. It appears clearly from literature that the nucleating ability of silver iodide is strongly dependent on the manner in which it is prepared. To understand the nucleation processes, superficial modifications of AgI crystals, such as presence of impurities, water absorption, reactions with surrounding atmosphere, etc., must be avoided. The best way to prepare pure silver iodide is to make iodine vapor react on a silver aerosol in an inert dry atmosphere and in darkness. Procedures and equipment were described for the preparation of a monodispersed aerosol of pure silver iodide which has the following properties: (1) particles per cu cm are 5,000,000, (2) average diameter is 20 angstroms, (3) threshold activity temperature as freezing nucleus is 2.5 times 10 to the 14th power active nuclei per gram AgI at -20C. These results for size distribution and freezing activity show reasonable agreement with Fletcher's theory. It is difficult to compare this work with other author's results because it is the first time that particles with such a small size were studied as ice nuclei. This pure silver iodide aerosol may be useful for further studies on the influence of various factors on nuclea tion mechanisms. (See also W75-09944) (Sims ISWS)

Descriptors: *Tracers, *Convection *Thunderstorms, *Weather modification *Illinois, Cloud seeding, Nucleation, Aircraft Sampling, Distribution patterns, Rain water Storms, Precipitation(Atmospheric), Clou physics, Meteorology.
Identifiers: *Pyrotechnic devices, Indium, Ic nuclei.

A field experiment, based on the indium trace technique and the silver iodide seeding of convec tive systems by airborne pyrotechnic flares, wa conducted in central Illinois on 1 June 1970 an yielded a comprehensive pattern of indium depos tion. Study of the indium deposition pattern show that material placed nominally in a convective up draft above and ahead of a cold frontal zone ma be transported in considerable quantities into th region below and behind that zone. The obviou transport mechanism is found in the downdraft which are necessarily interspersed with the up drafts throughout the sub-cloud adiabatic layer. I was concluded that somewhat less than 17% of th silver iodide, generated and placed similarly fo convective cloud modification, penetrates intac to the cloud regions where it can nucleate the ic phase by contact with super cooled water droplets This fraction of seeding agent is most likely to fa in a size range averaging somewhat less than 0. micrometer in radius. It was therefore implied tha silver iodide seeding via convective updrafts ma be improved in efficiency by limiting the size o the silver iodide particles to the range from 0.05 t 0.1 micrometer as they are generated. **ICE NUCLEI GENERATOR TECHNOLOGY,**
Denver Research Inst., Colo.
N. Fukuta.
In: Proceedings of the World Meteorological Or ganization/International Association o Meteorology and Atmospheric Physics Scientifi Conference on Weather Modification, October 1 7, 1973, Tashkent (USSR), WMO No 399, Genev (Switzerland), p 521-529, 1974. 2 fig, 15 ref.

Descriptors: *Weather modification, *Cloud seed ing, *Nucleation, Crystals, Silver iodide, Carbo dioxide, Toxicity, Engineering, Cloud physics Clouds, Precipitation(Atmospheric), Atmospheri physics, Meteorology.
Identifiers: *Ice nuclei, Ice nuclei generators, Dr ice, Nucleants.

Discussed were problems related to the ice-nucle generation technique, their characteristics, an their usage within the reacting cloud system. Ther are two methods of particle generation, i.e., th

spersion and condensation methods. Experimen-
l and theoretical studies of ice-forming nuclei in-
cate that the optimum size for cloud seeding is
ound 0.1 micron in radius or slightly less. The
st method of submicron particle production is
at of condensation. The control of nucleant par-
le size is probably the most important problem
r seeding generator development. The nuclei
rticles generated are subject to deactivation.
agulation is also important during the process of
oke generation. Small ice crystals formed by
eding of coolants disappear when they ex-
rience temperatures higher than 0C. The ice
stal growth rate by diffusion, at a given time
er nucleation, shows two maxima with respect
temperature, at -6.5 and at -18C. For effective
eding, it is desirable for the cloud parcel to main-
n upward motion so that the ice crystal growth
ntinues. The results of seeding experiments are
oendent on the particular nuclei compound
d. An advantageous feature of a particular
cleant for one condition can often become a
wback for another. The best approach appears
develop several different kinds of nucleants,
h having advantageous features in its own area.
knowing the nucleants features in nucleation,
understanding their interactions in cloud
cesses, and by making use of computer model-
optimum use of the seeding material may be
ght. (See also W75-09944) (Sims-ISWS)

tifiers: *Liquefied propane.

oratory tests at various temperatures but with
tant cloud densities yielded ice crystal
uction efficiencies between 2 times 10 to the
power and 6 times 10 to the 11th power
als per gram of propane. The efficiency
eases rapidly above -2C but is still 10 to the
power crystals per gram within a few tenths
degree below 0C. The results of the field tests
the 0.5-mm solid stream nozzle showed more
bility, the nucleating efficiency varying
een 10 to the 11th power and 5 times 10 to the
power crystals per gram in apparent response
e combined effects of cloud density and wind
ity. Since these factors influence the rate of
supply of the seeded plume, this rate ap-
to be a limiting factor for the numbers of
als being produced. On the whole, the agree-
between laboratory and field tests was
actory so that the extension of the field
s, on the basis of the laboratory tests, to tem-
ures not covered in the field tests appears to
stified. The shapes of ice crystals produced
eir growth rates indicate that the vapor pres-
within the plume was frequently depressed
water saturation. These observations
r confirm the critical role of vapor supply in
nining the seeding effect both in terms of the
ers of crystals produced and the size reached
crystals over a given path of length. The ex-
ents described confirmed the possible utility
efied propane as a cloud-seeding agent. (See

**SUMMARY OF OBSERVATIONS INDICATING DYNAMIC EFFECT ON SALT SEEDING IN WARM CUMULUS CLOUDS,**
Institute of Tropical Meteorology, Poona (India).
A. S. Ramachandra Murty, A. M. Selvam, and Bh. V. Ramana Murty.
Journal of Applied Meteorology, Vol 14, No 4, p 629-637, June 1975. 6 fig, 2 tab, 6 ref.

Descriptors: *Cloud seeding, *Weather modification, *Sodium chloride, *Clouds, Salts, On-site investigations, Cloud physics, Atmosphere, Precipitation(Atmospheric), Meteorology.
Identifiers: *Cloud dynamics, Cumulus clouds, Liquid water content.

Measurements of cloud liquid water content and temperature were made along with visual observations in 32 traverses carried out in six warm cumulus clouds subjected to salt seeding. The results showed (1) a rise, of 1-2C, in temperature; (2) an increase, sometimes exceeding 200%, in liquid water content; and (3) vertical growth, up to 60%, in seeded clouds which developed rain. The features could be due to the possible dynamic effect of salt seeding in warm clouds. (Sims-ISWS)

**WATER AND WATER PROBLEMS IN THE SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT AND SOME POSSIBLE SOLUTIONS,**
Southwest Florida Water Management District, Brooksville.
G. G. Parker.
Water Resources Bulletin, Vol 11, No 1, p 1-20, February 1975. 9 fig, 16 ref.

Descriptors: *Water management(Applied), *Planning, *Water supply, *Florida, Water quality control, Water distribution(Applied), Water utilization, Legislation.

It is estimated that by about 1984 water demand in the District will nearly equal the natural average annual replenishment of the supply and that, thereafter, unless means are developed to augment the in-District resources, water mining will be required on a grand scale. Sources of augmentation include: reduction of wastes; industrial recycling of previously-used water; use of municipal sewage effluents; desalination of brackish groundwater; aquifer recharge from all available, high-quality sources, particularly flood waters; and importation of excess water from such out-of-District sources as the lower courses of the Suwannee and Apalachicola Rivers. To achieve maximum beneficial uses of in-District sources, a regional water and sewer authority is needed that can develop and transmit water from all available sources to the various county and city systems on a wholesale basis. It is envisioned that such a supply system would tie together all production sources, much as the electrical generation and supply systems are currently organized into regional electric power hookups. At least two bills are currently before the Florida Legislature to achieve these goals. (Bell-Cornell)

TOTAL APPROACH FOR THE BOGOTA, COLUMBIA, WATER SUPPLY,
Empresa de Aqueducto y Alcantarillado, Bogota (Colombia).
J. Gonzalez, and M. S. Clark, III.
Journal of the American Water Works Association, Vol 67, No 6, p 327-331, June 1975. 5 fig, 3 ref.

Descriptors: *Water supply development, *Systems analysis, *Planning, Optimization, Simulation analysis, Linear programming, Dynamic programming, Computer programs, Irrigation, *Municipal water, Hydroelectric power, Decision making, Hydrology, Tunnels, Economics, Operations research, Screening, Alternative planning.
Identifiers: Cost minimization, Operating rules.

Water-related problems associated with rapid population growth in Bogota, Columbia have been the subject of a recent comprehensive engineering study. Summarizes are presented of the system-analysis portion of the study related to water resources development planning. The application of simulation, linear programming, and dynamic programming was instrumental in a multidisciplinary approach for selecting a minimum cost plan for municipal water supply, irrigation, and hydroelectric developments. Computer programs and systems analysis techniques were necessary in handling voluminous data and complex problems for six major activities: (1) development of monthly flow records; (2) analysis of daily flow records; (3) comparison of subsystems of diversion tunnels; (4) preliminary screening; (5) sensitivity analysis; and (6) simulation of alternative systems. For selected tunnel configurations, a minimum-cost solution and economical scale of development were obtained by dynamic programming. Linear programming was employed in preliminary screening and to examine the economic aspects of system operation and water-use allocation. Simulation related the studies of hydrology and tunnel-diversion subsystems. It identified maximum supply rates and searched for least-cost component capacities and operating rules. The general procedure for system operation was divided into four considerations: reservoir operation; irrigation; water supply; and power. Satisfactory solutions to real-world planning problems were found. (Bell-Cornell)

## 3E. Conservation In Industry

ELECTROLYTIC DECOMPOSITION OF WATER,
Westinghouse Electric Corp., Pittsburgh, Pa. (assignee)
L. E. Brecher, and C. K. Wu.
US Patent No 3,888,750, 3 p, 10 fig, 12 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 935, No 2, p 721, June 10, 1975.

Descriptors: *Patents, *Electrolysis, Electrolytes, Ionization, Oxidation, *Chemical reactions, *Separation techniques, Hydrogen, Oxygen.
Identifiers: Water decomposition, Thermochemistry, Hydrogen production.

Electrolysis and catalytic thermochemistry are combined to decompose water. The object of the invention is to produce hydrogen for coal conversion into hydrocarbons and other purposes by decomposition of water at a minimum cost in energy. The electrolyte is H2S03 produced by supplying S02 and the water to be decomposed to the electrolyzer. The H2S03 is ionized and oxidized in the electrolyzer into S04= and H+ ions and electrons. Hydrogen is derived from the negative electrode of the electrolyzer. The S04= is combined with H+ to form H2S04. The H2S04 is removed from the electrolyzer to the thermochemical unit, concentrated and decomposed predominately into H2O, SO2 and O2. The SO2 is liquefied and thus separated from the O2 which is derived from the thermochemical apparatus. The liquid SO2 is vaporized and returned to the electrolyzer. (Sinha-OEIS)

ARTIFICIAL REEFS FOR TEXAS.
Texas A and M Univ., College Station. Industrial Economics Research Div.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-10853, $3.75 in paper copy, $2.25 in microfiche. Sea Grant Program Report TAMU-SG-73-214 (IAC (72-73)-1225), March 1974. 39 p, 11 fig.

Descriptors: *Fisheries, *Reefs, *Texas, Fish management, Financing, Legal aspects, Commercial fishing, Sport fishing, Habitats, Sites, Materials, Costs, Gulf of Mexico, Buoys.
Identifiers: *Artificial salt water reefs.

There is a lack of natural or accidentally created reefs to satisfy the increasing demand for sport and commercial fishing in Texas thus the construction of artificial reefs is investigated. The function of an artificial reef is to provide shelter for fish and to allow marine organisms to attach themselves, thus providing food for fish and establishing a food chain. Reef material suitability should be judged on availability, costs, durability in salt water and environmental impact. Usage of rubber tires, concrete pipes and blocks, automobile bodies, ships and barges, offshore oil platforms and other materials is evaluated. Proposed utilization of World War II Liberty Ships as reef material is discussed. The determination of site location for man-made reefs must include many factors among them are: (1) avoidance of shipping fairways; (2) knowledge of existing bottom obstructions, depth, and seabed characteristics; and (3) availability of site to potential users. Total costs of a reef include materials, preparation, handling, sinking, marking and policing. Project financing is potentially available from state and national governmental agencies and from special interest groups, who often contribute materials, labor, and funds. Legal ramifications of submerged construction are discussed in terms of liability, public access, common law, navigation, conflicting uses, jurisdiction, and international law. (Becker-Wisconsin)

**T OF WATER TABLE DEPTH ON YIELD BBAGE, SQUASH AND TENDERGREEN,**
ltural Research Service, Raleigh, N.C.
R. E. Williamson, and T. N. Gray.
J Am Soc Hortic Sci. Vol 98, No 2, p 207-209, 1973.
Identifiers: Brassica-oleracea-var-capitata, Brassica-perviridis, *Cabbage, Cucurbita-pepo, Squash, Tendergreen, *Crop production, *Water table depth.

Cabbage, Brassica oleracea var. capitata L., squash Cucurbita pepo Alef. and tendergreen, Brassica perviridis Bailey, were grown at various water table depths in sheltered soil tanks on a fine sandy loam and a loam soil to evaluate the effects of high water table and soil type on growth and yield of these vegetable crops. Yields of the 3 species increased with water table depth to a depth of 76-102 cm. On both soil types the 15-cm water table depth caused considerable yield reduction and chlorosis for the 3 species. For maximum yields deeper water table depths were needed with loam than with sandy loam soil. Yield of cabbage was not significantly increased at water table depths greater than 30 cm in either soil. Squash yield was highest at water table depths of 61-76 cm in the fine sandy loam and 91-102 cm in the loam soil. Tendergreen yield was not significantly increased by water table depths greater than 61 cm in either soil.--Copyright 1973, Biological Abstracts, Inc.

**IRRIGATION EFFICIENCIES IN PRODUCING CALORIES AND PROTEINS: AN ANNOTATED BIBLIOGRAPHY,**
California Univ., Los Angeles. School of Public Health.
E. L. Rada, and R. J. Berquist.
California Water Resources Center, Davis, Report No 31, February 1975. 65 p, 280 ref.

Descriptors: *Irrigation efficiency, *Bibliographies, *Crop production, *Agriculture, *Nutrient requirements, Proteins, Water distribution(Applied), California, Water utilization, Energy conversion.
Identifiers: *Food production, Calories.

This annotated bibliography concerns the use of distributed water for the production of food crops eventually converted to human inputs of calories (energy) and proteins (growth-energy). A thorough literature search of the 1960's to 1970s was made dealing with various aspects of the questions, i.e., when measured in calorie-protein terms which crops are the most nutritious and which are most efficiently produced relative to distributed water used. The literature was searched by keying on certain words, such as water use, calories, food production and so forth. Concentration was largely on references dealing with plant production and their relation to water usage. Entries dealing with nutrient-composition of foods came primarily from USDA publications. References on crop production focused primarily, though not exclusively, on California. In the water resource area, the California Department of Water Resources, the University of California-Davis Departments of Agriculture and Engineering and Water Sciences, and the Giannini Foundation of Agricultural Economics at UC-Berkeley yielded the majority of entries. References include reports and articles on water resource development, irrigation efficiency, and consumptive use of water. A cross-reference by numbers is provided according to subtopics under the headings of nutrition and energy, water resouces, and agricultural production. (Jones-Wisconsin)
W75-10076

**SPRINKLING CATTLE FOR RELIEF FROM HEAT STRESS,**
California Univ., Davis. Dept. of Agricultural Economics.
S. R. Morrison, R. L. Givens, and G. P. Lofgreen.
J Anim Sci, Vol 36, No 3, p 428-431, 1973. Illus.
Identifiers: *California, *Cattle, Feed, Heat stress(Cattle), Refrigeration, Sprinkling, *Imperial Valley(Calif).

Sprinkling cattle under shades during the summer in the Imperial Valley of California for 1 min every 30 min when the temperature was above 80F (27C) resulted in significantly higher feed consumption and rate of gain compared with cattle under shades and not sprinkled. Efficiency of feed conversion, although favoring the sprinkling treatment, was not significantly improved over that of uncooled cattle. Sprinkling was as effective as a refrigerated air conditioned barn at 75F (24C) in 1 trial and more effective during a 2nd trial. Sprinkling and refrigeration promoted greater comfort as indicated by lower respiratory rates and body temperatures in the afternoon. Both noncooled and cooled cattle consumed more feed and gained more weight with 40 ft2 (3.7 m2)/head of space than with 20 ft2 (1.86 m2).--Copyright 1973, Biological Abstracts, Inc.

**DEW DURATION IN CENTRAL IOWA,**
Iowa State Univ., Ames. Dept. of Agronomy.
R. H. Shaw.
Iowa State J Res. Vol 47, No 4, p 219-227, 1973, Illus.
Identifiers: *Dew duration, Grass, *Iowa, *Pathogens(Plants), Reproduction, Soybean, Wetness, Corn(Field), Relative humidity.

Dew provides periods of crop wetness for reproduction of many plant pathogens. Dew observations were made at Ames, Iowa, during the growing seasons of 1953 and 1954. On rainless nights dew was present 50% of the hours from 8 p.m.-6a.m. on soybeans and 41% on corn in 1953, and 63% of the time on soybeans in 1954. On rainless nights for the June-Aug. period, dew collected on 88% of the nights on grass, 85% on soybeans and 73% on corn in 1953 and on 88% and 86% of the nights on grass and soybeans, respectively, in 1954. Hours of relative humidity (in the field) above 85% caused 29%-64% of the variation in dew duration.--Copyright 1973, Biological Abstracts, Inc.

**MECHANICAL MANAGEMENT OF AQUATIC VEGETATION: ANALYTICAL STUDIES OF UNIT OPERATIONS POTENTIALLY USEFUL IN THEIR PROCESSING,**
Wisconsin Univ., Madison. Dept. of Mechanical Engineering.
S. H. SY.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 593, $7.50 in paper copy, $2.25 in microfiche. Ph D Thesis, 1974. 216 p, 25 tab, 34 fig, 43 ref, 5 append. OWRT B-078-WIS(1). 14-31-0001-3947.

Descriptors: *Dewatering, *Separation techniques, *Harvesting, *Aquatic weed control, *Mulching, Mechanical equipment, Treatment, Feeds, *Wisconsin, Management.
Identifiers: Dane County(Wis).

Dewatering processes and solid-liquid separation methods applied to harvested aquatic vegetation as an aid to handling and/or utilizing it are described. An 'initiation pressure' was defined and was shown to be a useful quantitative parameter indicative of the ease of dewatering aquatic vegetation. Subsequent use of this parameter improved the validity of a moisture predicting function. For the case of constant pressure dewatering, two separate mechanisms were observed (1) a short 'initial rate' period and (2) a 'falling rate' period characterized by a slow decay in the rate of moisture expression. A second-order rate mechanism was derived to describe this latter period. Solids content in the expressed liquid remained relatively constant over the pressing period. A significant fraction of the solids in the expressed liquid could be recovered by gravity separation. The chemical composition and variations in composition of Eurasian watermilfoil were investigated. Peak crude protein content was only slightly lower than that of alfalfa. Calcium and xanthophyll contents were high and crude fiber low relative to forage crops. The composition appears to make Eurasian watermilfoil a possibility in low-fiber rations in addition to its present use as a soil additive. (Koegel-Wisconsin)

**WAVE QUENCHING DEVICE,**
Baker Hydro, Inc., Irvine, Calif. (assignee)
D. A. Stanwood.
US Patent No 3,886,602, 5 p, 8 fig, 7 ref; Official Gazette of the United States Patent Office, vol 935, No 1, p 19, June 3, 1975.

Descriptors: *Patents, *Floats, *Turbulence, Swimming, Swimming pools.
Identifiers: Wave damping, Float design.

A float to be strung on lines to mark the lanes for swimmers in a racing meet is molded in one piece from plastic and is comprised of wafer components preferably being discs and interconnecting barrier elements. The wafers are uniformly spaced along the axis of the float and normal to that axis. The barrier elements are normal to and extend between confronting faces of adjacent wafers. Four barrier elements comprise a set in the space between two adjacent wafers and they are in a relationship of quadrature. Longitudinally of the float the barrier elements are aligned in four sets paralleling the axis of the float. The wafers are thin in relation to the spacing between adjacent ones and their exposed edges are rounded. A bore extends through the float from end to end so that the floats may be strung end to end on a line to mark the boundary between adjacent racing lanes. Waves striking the rounded edges of the wafers are not significantly reflected back toward the swimmer by the edges of the wafers but instead slide off sideways and enter the space between adjacent wafers. The wafers direct the turbulent water entering the spaces between the wafers to impinge upon the faces of the barrier elements or baffles which resist the force of the turbulent water due to the freedom of the float to rotate on the line which supports it. Thus wave energy is absorbed and turbulence quelled. (Sinha-OEIS)
W75-09871

**DRAINAGE SYSTEM COOPERATES WITH NATURE,**
Woodland Development Corp., Houston, Tex.
J. A. Veltman.
Public Works, Vol 106, No 2, p 86-87, February, 1975. 1 fig.

Descriptors: *Drainage, *Storm runoff, *Planning, Aquifers, Groundwater, Project planning, *City planning, Water resources development, Flood control, Land management.
Identifiers: Woodlandt(Tex), Houston(Tex).

A natural drainage system is being developed to treat storm water runoff for a planned city called The Woodlands, near Houston, Texas. The existing natural drainage system, Panther Creek, will be used as fully as possible as the trunk line for the system. Where natural drainage is not efficient, due to lack of slope or topography, shallow swales lined with native vegetation will be constructed to handle the water flow. In addition, retention ponds and other flood control devices will be used. Pipes and concrete systems will be used only when urban activity causes storm flow to exceed the system's natural capacities. The proposed plan will result in a city with a population of 150,000 with park-like areas throughout. The system should be effective in dealing with a peak flow of storm water runoff, as compared to a conventional system of curbs, gutters, storm sewers, and concrete ditches. Protection of the water resources including two main aquifers (recharge capacity of 65 mgd) will be incorporated into the design. Penetration of several shallow clay layers will be prohibited, so that vertical groundwat movement will be impeded; residential buildin built over the aquifers will be without basemer to avoid puncturing these layers. The system i cludes the use of existing swales, ponds, lo spots, and streams to hold rainfall rather th widespread building of storm sewers. The syste will also discharge underground water tables, tr erosion sediment and diminish sudden runof which could cause flash flooding and relat damage. (Prague-FIRL)
W75-09942

**A METHOD FOR PREDICTING FLOO WATER RUNOFF OF THE RIVER STEYR (E VERFAHREN ZUR VORHERSAGE DE HOCHWASSERABFLUESSE DER STEYR),**
W. Kresser, and D. Gutknecht.
Oesterreichische Wasserwirtschaft, Vol 26, N 11/12, p 249-259, 1974. 11 fig, 3 tab, 7 ref.

Descriptors: *Flood forecasting, *Runoff, Mod studies, Monitoring, Data analysis, Precipi tion(Atomspheric), Flood control, Rivers.
Identifiers: *River Steyr(Germany), Predicti models.

A model for the prediction of flood water runoff the Steyr River, Austria, is presented. The meth is based on a precipitation runoff model usi precipitation monitoring data. This runoff mod consists of: a model for the determination of t runoff formation; another model for the det mination of the direct runoffs; and a third mod for calculating basic runoffs for the characteri tion of runoff occurring during the precipitati event. The prediction model gave satisfactory b no optimal results. The runoff formation model the weakest link of the prediction method. A rap decrease in the accuracy of the predictions w the extension of the prediction period was foun corresponding to a rapid reaction of the river to tense precipitation. (Takacs-FIRL)

**EVALUATION OF RESERVOIR SITES IN NORTH CAROLINA--REGIONAL RELATIONS FOR ESTIMATING THE RESERVOIR CAPACITY NEEDED FOR A DEPENDABLE WATER SUPPLY,**
Geological Survey, Raleigh, N.C.
F. E. Arteaga, and E. F. Hubbard.
Water-Resources Investigations 46-74, February 1975. 60 p, 16 fig, 1 plate, 4 tab, 13 ref.

Descriptors: *Reservoir design, *Reservoir evaporation, *North Caolina, Frequency analysis, Frequency curves, Estimating, Water storage.
Identifiers: *Draft-storage-frequency relations.

Draft-storage-frequency relations, which show the storage required for a reservoir to furnish a specified withdrawal or draft are regionalized for four zones in North Carolina using the mean annual flow of the streams as an index. The differences between the zones primarily reflect differences in the variability of streamflow. To assure the available draft will fall below 75% of the mean annual flow of a stream only once in 50 years on the average, a reservoir in the mountains would need a usable storage capacity of 45% of the mean annual runoff of the impounded stream. In comparison, reservoirs in parts of the Piedmont furnishing a draft of 75% of the mean annual flow must have usable storage equal to 60% of the mean annual runoff of the stream. In the inner Coastal Plain the storage required increases to 84% and in the outer Coastal Plain to about 110%. These increases in storage are indicative of the general increase in streamflow variability, both seasonally and between years, from west to east in the State. Net evaporative draft also varies from west to east. For instance, a reservoir impounding a Piedmont stream, and designed with a 5 percent chance of deficiency, will have a net evaporative draft about twice as large as a similar sized reservoir in the Coastal Plain. In the mountains, annual precipitation always exceeds evaporation because of the cooler temperatures and higher rates of precipitation. (Knapp-USGS)

**RESERVOIR RELEASE ROUTING MODEL FOR THE UPPER ARKANSAS RIVER BASIN OF COLORADO,**
Geological Survey, Denver, Colo.
R. R. Luckey, and R. K. Livingston.
Colorado Water Conservation Board, Denver, Water Resources Circular No 27, 1975. 44 p, 12 fig, 1 tab, 5 ref, 2 append.

Descriptors: *Reservoir releases, *Model studies, *Colorado, River basins, Methodology, Computer models, Input-output analysis, Water yield, Bank storage, Channel flow, Inflow, Discharge(Water), Correlation analysis, Reservoir operation.
Identifiers: *Arkansas River basin(Colo), Twin Lakes(Colo), Colorado Canal.

A model for routing reservoir releases has been developed that accounts for channel storage, bank storage, inadvertent diversions (additional diversions caused by increased river stage), and travel time. Channel storage in the reach is calculated each time step as a linear function of the inflow to the reach. Inadvertent diversion is a function of the size of the release in the reach and the initial flow in the reach. Bank storage is a function of the inflow to the reach, outflow from the reach, and aquifer parameters. Because bank storage and outflow are interdependent, repetitive calculations are made until the calculated rate of bank sotorage ceases to change significantly. The final outflow from a reach then becomes the inflow to the next reach. This model has been tested by routing reservoir releases from Twin Lakes to the Colorado Canal in the upper Arkansas River basin. During periods when conditions on the river are relatively stable, the model produces hydrographs that are in excellent agreement with the observed hydrographs. (Woodard-USGS)

Identifiers: *Lake Balaton(Hungary), Water rise, Loss functions, Sensitivity analysis, Discounting, Loss minimization, Event-based model.

Wind waves and wind tides may cause severe damage along large lake or reservoir shores when the average water level is high. Shallow lakes, however, need to maintain a high storage level in order to minimize losses in tourism, navigation and ecology. The optimal release policy for a large and shallow lake subject to the double uncertainty of average monthly hydrologic input and instantaneous wind-induced water rise is calculated. The case of Lake Balaton in Hungary is used to illustrate the methodology. Loss functions are obtained for each lakeshore section; losses due to unfavorable (high or low) water level are given on a monthly basis, and dynamic losses due to waves and wind tides are calculated by using an event-based model. The physical model is defined with the associated events and transformation functions. Then economic loss functions are introduced and accumulated around the lake. A stochastic dynamic programming formulation yields an optimum release policy whose sensitivity to loss function and discount factor is examined. (Bell-Cornell)

Journal of the Hydraulics Divisions, Proceedings of ASCE, Vol 100, No HY11, Paper No 10934, p 1519-1535, November 1974. 4 fig, 3 tab, 15 equ.

Descriptors: *Colorado River, *Streamflow, *Management, Hydraulics, *Dams, Storage, Water delivery, Conservation, Control, Operations, Diversion, Flow characteristics, Water supply, Digital computers, Downstream, Return flow, Powerplants, Gaging stations, Storms, Reach(Streams), Communication, Data transmission, Natural streams, Equations, Velocity, Effects, Estimating, Lakes.
Identifiers: *Transient flow, Prediction, Flow routing, Losses.

A method of computing transient flow changes in a flowing stream is described. The results of more than five years of experience in the use of this method for estimating flows at the gaging stations of the 147-mile Parker-Imperial reach of the Colorado River are summarized. An account is made of digital computer applications which enable tabulations of the expected flows at the gaging stations for each hour of the ensuing 24 hours to be made and transmitted to the Boulder City Office of the USBR in time to be available at the beginning of each work day. Tabulation covering 72 hours is prepared for weekend operations. Demonstrated is the usefulness for tightening control of the river for purposes of preventing the waste of water. (Bell-Cornell)

Journal of the Hydraulics Division, Proceedings of ASCE, Vol 100, No HY3, Paper No 10418, p 405-424, March 1974. 14 fig, 28 equ, 8 ref, 3 append.

Descriptors: *Open channel flow, *Unsteady flow, *Hydraulics, *Weirs, *Gates, Flood forecasting, Flood control, Projects, Operation, Management, Equations, Mathematical models, Systems analysis, *California.
Identifiers: *Sacramento River(Calif), Method of characteristics, Geometry.

The transient controlling gate and valve-stroking concept recently developed and verified by Streeter and Wylie at the University of Michigan is extended to the operation of the Sacramento weir gates during periods of high flows in the river. The weir is located several miles upstream from Sacramento and is the only one operated at high stages to maintain a 29.0-ft. maximum stage at the Sacramento 'I' Street gage. High inflow from the regulated American River between the weir and the gage often causes flow to reverse in a portion of the Sacramento River, but this complication is easily handled by the method of characteristics. Although the gate-stroking technique is extended to operation of the Sacramento weir, the same extension can be made to natural and artificial channels in which a control structure is located. The three sections analyzed are: (1) basic theory of unsteady flow and the development and application of the characteristic equations; (2) the geometry of the lower Sacramento River; and (3) transient control of the lower Sacramento River. The gate operation technique allows the determination of whether flood conditions now developing in the Sacramento or release schedules anticipated from upstream dams can be conveyed within the system without violating the project flood plain. Furthermore, extension of this type of scheme could permit the internal optimization of release schedules and weir operation such that the operation of the conveyance system is optimized. Included is an appendix with more detailed treatment on development of the unsteady and characteristic equations. (Bell-Cornell)

Identifiers: *Environmental impact statemen *Talbot County(Md), Navigation obstructions.

This project entails the hydraulic dredging of proximately 2 miles of channels in the Tred Av River, consisting of two navigation channels feet deep and 150 feet wide and a turning basin feet deep and 250 feet wide. Approximat 333,000 cubic yards of material will be remov and deposited in any of five nearby disposal are The river is an estuarine stream draining ab 29,300 acres of primarily agricultural land on eastern shore of Maryland. The deepened chan will reduce navigation hazards to commercial v sels, thereby enhancing the economic devel ment of the region. Greater sport fishing may a be generated. Project dredging will disturb remove benthic organisms, temporarily increa turbidity in the river, and destroy wildlife habi at the disposal areas. Alternative considered w no action, various channel depths and widths, alternate spoil disposal methods and sites. sites chosen were considered to be the least val ble environmentally. The loss of productivity the area due to destruction of benthic organis and use of agricultural lands for disposal site expected to be minimal. Opposition to this proj centers around the destruction of oyster beds the use of wetlands as disposal sites. (Decke Florida)

Descriptors: *Patents, *Subsurface waters, *Wells, *Water levels, *Groundwater movement, Equipment, Valves, Water utilization.

Systems for removing water from the ground include a series of well points sunk into the ground at spaced intervals and a pumping unit for drawing water out of the ground through the well points. The apparatus of this invention automatically adjusts the flow of water to the pump from each well point in accordance with the amount of air being drawn into the particular well point. At the same time, the apparatus maintains a reduced pressure in the well point, whereby the flow of water to the pump is re-established when the air drawn into the well point decreases. A float-actuated valve connects the pump and the well point and controls the flow of water to the pump in accordance with the flow rate of water drawn into the well point. An air passageway bypasses the valve to provide a reduced pressure condition in the pipe when the valve is closed. (Sinha-OEIS)

**INJECTION-PIPE SYSTEM FOR ARTIFICIAL RECHARGE,**
Geological Survey, St. Paul, Minn.
H. O. Reeder.
Available from Sup Doc., D.C. 20402, $3.15 single journal copy; $18.90 yearly subscription rate. Journal of Research of the U.S. Geological Survey, Vol 3, No 4, p 501-503, July-August 1975. 2 fig, 4 ref.

Descriptors: *Artificial recharge, *Injection wells, *Groundwater recharge, Methodology, Pipes, Piping systems(Mechanical), Friction, Hydraulics.
Identifiers: *Injection-pipe system.

An injection-pipe system was designed to utilize pipe friction in the well to maintain positive pressure and to eliminate gas release and air entrainment in the injection water. The size of the injection pipe was selected on the basis of obtaining a unit friction head loss per equal-unit length of pipe for the desired injection rates. The injection rates are 70 gallons per minute through a 11/4-inch heavy duty pipe and 106 gal/min through a 1 1/2-inch heavy duty pipe. A diagram shows flow rates through other pipe sizes. **GEOTHERMAL INVESTIGATIONS IN IDAHO: PART 3, AN EVALUATION OF THERMAL WATER IN THE WEISER AREA, IDAHO,**
Geological Survey, Boise, Idaho.
H. W. Young, and R. L. Whitehead.
Idaho Department of Water Resources, Boise, Water Information Bulletin No 30, May 1975. 35 p, 13 fig, 4 tab, 30 ref.

Descriptors: *Geothermal studies, *Idaho, *Thermal water, *Thermal properties, Water quality, Geophysics, Data collections, Water temperature, Thermal springs.
Identifiers: Geochemical thermometers, Chemical ratios, Weiser area(Idaho).

The Weiser area encompasses about 200 square miles in southwest Idaho and contains two thermal water areas: (1) the Crane Creek subarea, which is 12 miles east of Weiser, Idaho, and (2) the Weiser Hot Springs subarea, which is 5 miles northwest of Weiser. Volcanic and sedimentary rocks of Miocene to Pleistocene age have been faulted and folded to form the northwest-trending anticlines present in much of the area. Basalt of the Columbia River Group or underlying rocks are believed to constitute the reservoir for the hot water. Sampled thermal waters are of a sodium chloride sulfate or sodium sulfate type, having dissolved-solids concentrations that range from 225 to 1,140 mg per litre. Temperatures of sampled waters ranged from 13 to 92 deg C. Minimum aquifer temperatures calculated from chemical analysis of water, using geochemical thermometers, were 170 and 150 deg C in the Crane Creek and Weiser Hot Springs subareas, respectively. Estimated maximum temperatures ranged from 212 to 270 deg C and 200 to 242 deg C, respectively, in these subareas. The probable heat sources for both subareas are (1) young magmatic intrusive rocks underlying the basalt or (2) above-normal temperatures resulting from thinning of the earth's crust. (Woodard-USGS)

**WATER DEVELOPMENT FOR IRRIGATION IN NORTHWESTERN KANSAS,**
Geological Survey, Lawrence, Kans.
E. D. Jenkins, and M. E. Pabst.
Open-file report 4-75, 1975. 39 p, 23 fig, 6 plate, 3 tab, 34 ref.

Descriptors: *Irrigation wells, *Groundwater resources, *Kansas, Semiarid climates, Aquifer characteristics, Pumping, Water yield, Water quality, Chemical analysis, Water level fluctuations, Hydrologic data, Withdrawal, Groundwater recharge.

Northwestern Kansas, an area of 8,050 square miles, is a flat to gently rolling plain that is dissected by the Smoky Hill and Republican Rivers. Loessial soils underlying the plain are ideal for cultivation. The climate is semiarid with the mean annual precipitation ranging from 16 to 21 inches. Precipitation occurring mainly as thunderstorms during the 6-month growing season is four to five times less than the potential evaporation. Principal aquifers are the Dakota Formation, which yields a few gallons per minute of water to domestic and stock wells; the ogallala Formation, which commonly yields 500 to 1,200 gallons per minute to irrigation wells; and the alluvium, which locally yields as much as 1,500 gpm to irrigation wells. Irrigation from wells has developed principally since the early 1950's. Development has increased from about 100 wells irrigating 10,000 acres in 1950 to about 2,200 wells irrigating 3000,000 acres in 1972. The rate of withdrawal by irrigation, municipal, and industrial wells in 1972 was about 5000,000 acre-feet of water per year, of which about 99% was for irrigation. A comparison of water levels measured in 1950 and in 1973 indicates that declines greater than 10 feet are common in much of the area. Declines greater than 30 feet have ocurred near Goodland and Colby. (Woodard-USGS)

**EFFECTS OF LOWERING INTERIOR CANAL STAGES ON SALT-WATER INTRUSION INTO THE SHALLOW AQUIFER IN SOUTHEAST PALM BEACH COUNTY, FLORIDA,**
Geological Survey, Tallahassee, Fla.
L. F. Land.
Open-file report FL 75-74, 1975. 59 p, 19 fig, 8 ref.

Descriptors: *Water level fluctuations, *Canals, *Saline water intrusion, *Groundwater movement, *Florida, Model studies, Land development, Land management, Environmental effects, Water quality, Analytical techniques, Evaluation, Hydrologic data, Withdrawal, Aquifers, Construction.
Identifiers: *Lake Worth(Fla), Lowering canal stages.

Land in southeast Palm Beach County, Florida, is undergoing a large-scale change in use, from agricultural to residential. To accommodate residential use, a proposal was made to lower canal stages in the interior part of the area undergoing change. The two main tools used in the investigation were a digital model for aquifer evaluation and an analytical technique for predicting the movement of the salt-water front in response to a change of groundwater flow into the ocean. Test results show that lowering part of the interior canal water levels 3 feet does not affect the aquifer head or salt-water intrusion along the coastal area of Lake Worth. Lowering interior canal water levels by as much as 4 feet would result in some salt-water intrusion. (Woodard-USGS)

**HYDROLOGIC RECONNAISSANCE OF THE WAH WAH VALLEY DRAINAGE BASIN, MILLARD AND BEAVER COUNTIES, UTAH,**
Geological Survey, Salt Lake City, Utah.
J. C. Stephens.
Utah Department of Natural Resources, Salt Lake City, Technical Publication No 47, 1974. 53 p, 8 fig, 1 plate, 10 tab, 24 ref, append.

Descriptors: *Groundwater resources, *Surface-groundwater relationships, *Available water, *Water quality, *Utah, Drainage area, Hydrologic data, Hydrology, Precipitation(Atmospheric), Runoff, Streamflow, Aquifer characteristics, Water wells, Well data, Drillers logs, Chemical analysis.
Identifiers: *Wah Wah Valley(Utah).

The Wah Way Valley drainage basin includes about 600 square miles in Millard and Beaver Counties in southwestern Utah. Total runoff averages only about 7,800 acre-feet annually; all streams are ephemeral or intermittent; and surface storage is negligible. Evaporation and transpiration within the basin consume more than 97% of total annual precipitation. There is no surface outflow. Total annual recharge to the groundwater system is about 10,000 acre-feet. Estimates and measurements of discharge from the groundwater system total about 1,500 acre-feet. Recharge to and discharge from the groundwater system are assumed to be equal over a long period of time because there are no known changes of storage in the system. Thus, the difference between the totals for recharge and discharge represents surface outflow from the drainage basin. known groundwater sources in the basin fresh, very hard water. The highest concentra of dissolved solids (masimum 4,550 mg/litre found in groundwater from igneous rocks, an lowest (minimum 99 mg/litre) are found in from quartzite and carbonate rocks. (Wood USGS)

**REPORT OF COMMITTEE ON SURVEY GROUND WATER SUPPLIES IN NEW GLAND.**
New England Water Works Association, B (Mass).
Journal of the New England Water Work sociation, Vol 89, No 1, p 44-53, March 1975.

Descriptors: *Groundwater, *Water su *Surveys, Municipal water, Wells, *New En Maintenance, Water treatment, Iron, Mangan
Identifiers: Gravel wells.

A survey was made of municipal groundwate plies in several New England states, in respo concern over the environmental impact of development and a consequent increase in tion problems. Gravel packed and gravel-w wells were examined. The question was po to whether such wells have deteriorate decreased in their capacity. Opinions wer tained on the costs and benefits of preve maintenance programs for water wells and p ing equipment. Discussed also was treatme groundwater for inhibiting iron and mang problems. Public water supplies in Massachu Vermont, Maine, Connecticut, and Hampshire were discussed. In general, wells held their quality and capacities for many longer than previously expected. Maintenanc treatment methods varied, depending upo population of an area and the demand for gr water supplies. (Prague-FIRL)

## 4C. Effects On Water Of Man's Non-Water Activities

**HYDROLOGIC IMPACT OF PLANNED UNIT DEVELOPMENTS,**
Maryland Univ., College Park. Dept. of Civil Engineering.
R. H. McCuen, and H. W. Piper.
Journal of the Urban Planning and Development Division, American Society of Civil Engineers, Vol 101, No UP1, p 93-102, May 1975. 5 fig, 4 tab, 11 ref.

Descriptors: *Storm runoff, *Urban hydrology, *Urban runoff, *Model studies, Runoff forecasting, Urbanization, Infiltration, Hydrographs, Evapotranspiration, Subsurface flow, Roofs.
Identifiers: Planned unit development, Linked-process hydrologic model, Rooftop detention.

The hydrologic impact of planned unit developments (PUD) is examined. A linked-process hydrologic model was formulated to estimate the hydrologic impact of various land-use configurations and examine the potential of various storm water management practices. Components are included to simulate the various hydrologic processes such as interception, infiltration, evapotranspiration, surface retention and detention, subsurface flow, rooftop storage and runo', overland flow on impervious surfaces, gutter flow and storm sewer system routing, which are involved in transforming rainfall to storm water runoff. Peak discharges from a planned unit development have been computed to be as much as three times those of a single family detached dwelling unit and five times those of undeveloped land use. This fact makes it imperative that storm water management alternatives for PUD be investigated. The linked-process hydrologic model employed in this study appears to be a valid means for estimating the hydrologic impact of PUD and the effect of various storm water management alternatives. The use of rooftop detention may reduce peak discharge by approximately 4%. However, parking lot detention appears to be a more practical detention alternative. (Orr-FIRL)

**UTILIZATION OF AERIAL PHOTOGRAPHS FOR MEASURING LAND USE CHANGES IN WATERSHEDS,**
Clemson Univ., S.C. Dept. of Civil Engineering.
D. B. Stafford, J. T. Ligon, and M. E. Nettles.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 887, $3.75 in paper copy, $2.25 in microfiche. Presented at International Symposium on Remote Sensing of Water Resources, June 11-14, 1973, Burlington, Ontario, Canada. 23 p, 4 fig, 3 tab. OWRT A-024-SC(3).

Descriptors: *Watershed(Basins), *Land use, *Aerial photography, Remote sensing, *South Carolina, Urbanization, Runoff, Land management, *Land classification.

Techniques are described for using existing aerial photographs to investigate land use changes in watersheds. A primary objective was to measure the physical characteristics of historical land use patterns that affect the hydrologic parameters of a watershed. Land use changes in two watersheds in western South Carolina were examined. One of the watersheds has experienced rapid urbanization in recent years and the other watershed has experienced significant changes in agricultural land use over the past 26 years. Existing aerial photographs taken at approximately five-year intervals were used to delineate, classify, code, and measure the areas of various land use classes in the two watersheds. The land use classes employed were those that had experienced significant changes and which had different runoff characteristics. The area occupied by each land use class was measured on photographic enlargements by using a planimeter. Significant changes in land use were observed in the two watersheds. The results obtained from the research program indicate that the use of existing aerial photographs to obtain data on the historical distribution of land use in watersheds represents a very satisfactory approach that could be employed more widely.

Identifiers: *Environmental impact statements, *Tybee Island(Ga), Coastal zone management, Beach restoration, Coastal waters.

This project involves the restoration and periodic nourishment of 13,200 feet of ocean beach and construction of a rubble stone terminal groin extending 800 feet seaward. Proposed for the future, if needed, is the placement of two additional rubble groins 760 feet and 670 feet, respectively, and a 1200-foot extension to the terminal groin. Tybee Island is a small barrier island located off the central coast of Georgia. It is comprised of sand dunes and tidal marshes and its beach serves as a major vacation center during the summer months. The island has been continuously subjected to severe erosion due to wave and wind action. The project will result in the restoration and maintenance of the scenic beach area, stabilization of the eroding shoreline, sport fishery habitat, and enhancement of the island community. The project will also temporarily reduce water quality and fish population, and will disrupt the benthid community during construction. Various combinations of groins were considered as were several alternate borrow sites. Involving no irretrievable commitment of resources, the project will enhance the long-term economic development of the region. There is no significant opposition to this proposal. (Deckert-Florida)

# 5. WATER QUALITY MANAGEMENT AND PROTECTION

## 5A. Identification Of Pollutants

METHOD AND APPARATUS FOR DETECTING THE PRESENCE OF AN OIL SLICK ON A WATER SURFACE,
A. R. Kriebel.
U S Patent No 3,885,418, 4 p, 8 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 934, No 4, p 1385, May 27, 1975.

Descriptors: *Patents, *Oil spills, Oil pollution, *Water pollution control, *Pollutant identification, Monitoring, Equipment, Pollution abatement.
Identifiers: Oil film detector.

The invention provides an in situ floating oil film detector which can continuously monitor a number of local critical areas including the effluent from waste water treatment plants, offshore drilling platforms, piers where oil is being transferred to or from tankers, and inlets to congested water facilities or industrial water intakes where a hazard from floating oil exists. The detector consists of a cylinder positioned within a hollow cylindrical enclosure or shroud, the cylinder being driven about its axis as a constant speed by a drive motor. The detector floats on the water in such a manner that the cylinder is partially submerged in the water surface and, in the absence of an oil slick on the water surface, imposes a known and low value of torque on the drive motor due to the drag on the cylinder by the water film between the cylinder and the shroud. When an oil slick appears on the water surface, the surface of the rotating cylinder becomes coated with oil and the torque on the drive motor is increased, increasing the current through the drive motor. This increase in drive motor current is utilized to trigger a control circuit that signals the presence of the oil. (Sinha-OEIS)
W75-09865

OIL DETECTOR,
E. L. Brill.
US Patent No 3,887,907, 5 p, 10 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 935, No 1, p 421, June 3, 1975.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution control, Water quality control, *Sampling, Skimming, Monitoring, *Pollutant identification.
Identifiers: Hydrophobic collectors, Oil detection.

A method and apparatus for detecting the presence of oil floating on water is described. A liquid sample is continuously taken from the surface of the water at a substantially steady rate. A sample is collected of predetermined parameter, such as weight or volume, in a predetermined time as consitituting one cycle of the operation. Each sample is dumped at the end of each cycle. Using a skimmer which lifts a minimum of liquid from the surface of the water when no oil is present, but which lifts a much larger amount of liquid when oil is present, the invention provides a system wherein if the collected sample is substantially all water, the same is dumped at the end of each cycle without providing a signal. However, if the collected sample involves some volume of oil, the sample reaches a predetermined parameter in less than the usually predetermined time of dumping and therefore the collected sample is utilized to give a signal indicating the presence of oil. A flexible, hose-like elongated collector is utilized which has an attraction for the hydrophobic liquid resting upon the water to pick up the oil collected by an endless loop floating on the water. It is carried out of the water where a doctor blade scrapes the coated material from the collector hose. (Sinha-OEIS)

Descriptors: *Pollutant identification, Chemical analysis, Hydrogen sulfide, Electrodes, Permselective membranes, *Electrochemistry, Electrolytes.
Identifiers: Dissolved gas, Molecular hydrogen sulfide, Sparging, Gas-sensing.

The gas sparging technique and a new gas-sensing electrode were evaluated for the determination of dissolved molecular hydrogen sulfide at environmentally significant concentrations in water. From the sparging experiments approximate coefficients were obtained for the distribution of hydrogen sulfide between nitrogen and distilled water, seawater, or municipal sewage effluent. In the latter medium the volatility of hydrogen sulfide was very much less than predicted from the pH-total sulfide relationship. The selectrode, consisting of various semipermeable membranes, buffered electrolyte filling solution, silver-silver sulfide crystal sensor, and lanthanum fluoride internal reference electrode, gave a generally Nerstian response to more than 0.1 mg/l of molecular hydrogen sulfide. At lower concentrations the response was typically several tenths of a volt per decade of concentration, but was not reproducible among different samples or electrodes. Various sources of the anomalous behavior were considered. The electrode is recommended for in situ measurements of molecular hydrogen sulfide at concentrations greater than 0.1 mg/l. More work is needed to make it useful at lower concentrations. (EPA)

**AQUEOUS ODOR THRESHOLDS OF ORGANIC POLLUTANTS IN INDUSTRIAL EFFLUENTS,**
Georgia Univ., Athens. Dept. of Food Science.
D. A. Lillard, and J. J. Powers.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-242 734, $3.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/4-75-002, May 1975. 20 p, 5 tab, 15 ref. EPA 1BA027, R-802980-01.

Descriptors: *Odor, Water analysis, Organic wastes, Statistical methods, *Pollutant identification, *Industrial wastes, Effluents, Organic compounds, Air pollution, Organoleptic properties.
Identifiers: Odor thresholds, Extreme value calculations, Triangle test.

Odor thresholds in water were determined of organic pollutants that have been identified in industrial effluents. Seven to fourteen judges were used to determine the odor threshold values of 13 compounds at room temperature and 60C. Odor threshold values for the compounds in ppm at room temperature are: acenaphthene, 0.08; 2-ethyl-l-hexanol, 1.28; butanol, 2.77; geosmin, 0.13 x 10-3; 2-methyl naphthalene, 0.01; l-methyl naphthalene, 0.02; diacetone alcohol, 44.1; dibenzofuran, 0.12; 2-benzothiazole, 0.08; 2-mercaptobenzothiazole, 1.76; 2-ethyl-4-methyl-1,3-dioxolane, 0.38; caprolactam, 59.7; d-camphor, 1.29. Extreme value calculations were made to predict a concentration below which a certain percentage of the population might still be able to detect the compound(s). The threshold values obtained at 60C in most cases do not differ or are higher than those determined at room temperature. (EPA)

**STUDIES TO DETERMINE METHODS FOR CULTURING THREE FRESHWATER ZOOPLANKTON SPECIES,**
Fish and Wildlife Service, Yankton, South Dakota, North Central Reservoir Investigations.
D. B. Martin, and J. F. Novotny.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-242 764, $3.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/3-75-010, May 1975. 33 p, 2 fig, 9 tab, 20 ref. EPA 1BA021, EPA-1AG-0152(D).

Descriptors: *Cladocera, *Copepods, Invertebrates, *Fish food organisms, *Zooplankton, *Cultures, Bioassay, Fresh water, Bioindicators, Standing crops, Harvesting.
Identifiers: *Bosmina longirostris, *Chydorus sphaericus, *Cyclops bicuspidatus thomasi, Test animals.

Studies to determine laboratory methods for culturing unispecific populations of Bosmina longirostris, Chydorus sphaericus and Cyclops bicuspidatus thomasi were carried out. These cultures are to provide a source of animals to be used as live food for fish and as bioassay test organisms. B. longirostris was not successfully cultured. High mortalities, apparently associated with the phenomenon of 'air-locking,' always occurred during handling in the laboratory. C. sphaericus was successfully maintained in relatively dense cultures (approximately 1,000 per liter) using a mixture of dried foods, less than 37 microns in size. One-fourth of the standing crop was harvested each week without apparently reducing the production in the culture. C. bicuspidatus thomasi could be grown using both dried food and live Paramecium multimicronucleatum as an energy source. However, the latter resulted in higher standing drops. Total standing crop as well as the proportion of each life stage in the population fluctuated greatly in the C. bicuspidatus thomasi cultures. Both C. bicuspidatus thomasi and C. sphaericus were grown at 15C, at a light:dark cycle of 12:12 hours, and in a synthetic medium of known chemical composition. C. sphaericus was recommended as being best suited for live fish food and as a bioassay test animal. (EPA)

**ASBESTOS IN DRINKING WATER,**
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
G. H. Kay.
Journal of the American Water Works Association, Vol 66, No 9, p 513-514, September, 1974. 4 tab.

Descriptors: *Public health, *Asbestos, *Analytical techniques, *Potable water, Water sources, Water supply, *Pollutant identification, Water pollution sources, Foreign research, Filtration, *Minnesota, *Canada.
Identifiers: *Asbestiform fibers, Ontario(Can), Duluth(Minn).

Samples from the water supplies of 22 cities in Ontario, Canada, were assessed for asbestiform fibers. Charts present the asbestos fiber count and estimated mass concentration by distribution-system water and an analysis of the asbestos fiber count. Asbestos is apparently present in all surface waters of inhabited areas of Ontario. After evaluations of known information, the Ontario Ministry of Health advised that at the levels of concentration and size distribution of fibers reported, there was no evidence of an effect on health by the ingestion of asbestos particles. The City of Duluth, Minnesota, also discovered asbestiform fibers in its drinking water. Duluth will probably have to provide treatment, such as filtration, of its drinking water. Research needs to continue on the health hazard that may or may not be present at various levels of asbestiform fibers in drinking water supplies. (Orr-FIRL)

**QUANTITATIVE LARGE-VOLUME SAMPLING TECHNIQUE,**
Environmental Protection Agency, West Kingston, R. I. Northeast Water Supply Research Lab.
M. A. Levin, J. R. Fischer, and V. J. Cabelli.
Applied Microbiology, Vol 28, No 3, p 515-517, September 1974. 2 fig, 2 tab, 8 ref.

Descriptors: *Analytical techniques, *Bacteria, *Filtration, *Water analysis, Equipment, Laboratory tests, *Pollutant identification, Filters, *Sampling.
Identifiers: High-volume sampling, Most probable number.

A filtration technique for high-volume sampling (HVS) in water is described that can be used in combination with the most probable number technique (MPN) for the quantitation of microorganisms present at low densities. The apparatus consists of a Balston type AA cartridge filter, 2.5 by 6.4 cm, with a type 90 filter holder. The filter is made of borosilicate glass microfibers bonded with epoxy resin. It is 98% efficient for 0.3 micromillimeter particles. The HVS technique was used to obtain the MPN estimates of Salmonella densities in samples of marine waters around New York City. The HVS technique can be used in any sampling situation as long as a selective-enrichment medium is available for use in combination with the MPN procedure. (Orr-FIRL)

IEEE Transactions on Nuclear Science, Vol NS-22, No 2, p 874-891, April 1975. 15 fig, 57 ref.

Descriptors: *Monitoring, *Analytical techniques, *Pollutant identification, *Gas chromatography, Spectroscopy, Chromatography, Pesticides, *Organic wastes, Methodology, Organic compounds.

Methods for sample collection and pretreatment and for isolation and determination of specific organic compounds are reviewed. Methods presented include those designed for the determination of organochlorine, organophosphorus, and organonitrogen pesticides, phenoxy acid herbicides, polychlorinated biphenyls, organic solvents and other selected organic compounds. Gas chromatography is the most widely applicable and popular method for detecting and measuring specific organic compounds in water, waste water, and other environmental media. Gas chromatography used with selective detectors is the most sensitive and selective method for qualitative and quantitative determination of organic compounds that is available. The absolute identification of compounds that can be only tentatively identified by other means is made possible by the recent development and application of the computer-controlled gas chromatograph-mass spectrometer. Examples of the application of infrared, ultraviolet, and fluorescent spectroscopy; liquid chromatography; and thin-layer chromatography for organic analyses are also discussed. (Orr-FIRL)

**A RATIONAL APPROACH FOR PREDICTING THE DISSOLVED OXYGEN PROFILE IN RECEIVING WATERS,**
Oklahoma State Univ., Stillwater. School of Civil Engineering.
K. M. Peil, and A. F. Gaudy, Jr.
Biotechnology and Bioengineering, Vol 17, p 69-84, 1975. 9 fig, 14 ref.

Descriptors: *Analytical techniques, *Dissolved oxygen, Waste disposal, Streams, Biochemical oxygen demand, Environmental effects, Waste water(Pollution), Biodegradation, Forecasting, *Pollutant identification, Water pollution sources.
Identifiers: Environmental bioengineering, Oxygen uptake curve, BOD curve, Reaeration.

A new method has been developed for predicting the dissolved oxygen profile in a stream receiving biodegradable wastes. Because the level of dissolved oxygen in a stream influences the health of the aquatic environment, the amount of organic materials removed from waste water should be carefully determined. Such an engineering prediction is among the most complex in the field of environmental bioengineering. For this method the BOD curve is obtained using an open jug technique. The accumulated O2 uptake curve is then used in numerical integration with physical reaeration data for the receiving stream in order to predict the DO profile in the stream. In this case, 10-liter open jar reactors were utilized to obtain the O2 uptake curves, and the receiving stream was a 670-liter simulated stream apparatus. A good prediction of the actual DO was obtained. The effect of the reaeration constant K2 (agitation effect) on the kinetics of O2 uptake was studied. Increased agitation caused some increase in the BOD curve, with most of the increase coming after the plateau area in the O2 uptake curve, or after the low point along the DO sag curve. (Prague-FIRL)

**PETROLEUM POLLUTANTS IN SURFACE AND GROUNDWATER AS INDICATED BY THE CARBON-14 ACTIVITY OF DISSOLVED ORGANIC CARBON,**
Geological Survey, Reston, Va.
E. C. Spiker, and M. Rubin.
Science, Vol 187, p 61-64, January 10, 1975. 1 tab, 23 ref.

Descriptors: *Oil pollution, *Carbon radioisotopes, *Municipal wastes, Industrial wastes, *Organic compounds, *Pollutant identification, Rivers, Groundwater, Surface water, Water pollution sources.
Identifiers: *Petroleum effluents, C-14, Dissolved organic carbon.

Dissolved organic carbon (DOC) consists of organic compounds such as humic and fulvic acids, herbicides, pesticides, synthetic detergents, phenols, and petroleum hydrocarbons. Once the organic matter decomposes, carbon compounds are altered. While carbon dioxide is recycled, the carbon-14 content of organic carbon is not significantly affected by the synthesis. For this reason, the 14C activity of dissolved organic carbon can be used to distinguish between the two classes of organic carbon--those from petrochemical effluents and those from municipal wastes and agricultural runoff. The industrial wastes are composed of fossil petroleum products which contain no 14C; modern domestic wastes and naturally decaying matter contain approximately the modern atmospheric carbon-14 content. Rivers polluted by petrochemical effluents showed varying amounts of depression of the DOC 14-C activity, which reflects concentrations of 14C-deficient fossil carbon of as much as 40 percent of the total DOC. Studies of six rivers in the eastern United States were consistent with a model; seasonal variations in runoff and stream discharge were considered. (Prague-FIRL)

**A NEW INFRARED INSTRUMENT FOR MO TORING OIL FILMS ON WATER,**
Wright and Wright, Inc., Newton Center, Mass.
D. E. Wright, and J. A. Wright.
Marine Technology Society Journal, Vol 9, No p 22-24, January 1975. 4 fig.

Descriptors: *Oil pollution, *Monitori *Instrumentation, Oil spills, Oceans, Coas Laboratory tests, On-site tests, *Pollutant ident cation, *Infrared radiation.
Identifiers: Oil films, Infrared reflection, Infra Oil Film Monitor.

A new infrared oil film monitor has be developed to detect oil slicks by remote metho The technique is based on the infrared reflectan properties of water surfaces at the three-micr spectral region where sharp changes in reflectan occur due to absorption bands. The reflectance water differs from the reflectance of an oil f with regard to a peak and valley shaped graph water spectral reflectance, absent with an oil fi Both laboratory and field tests have shown t this instrument can detect oil spills during weather and lighting conditions. Design chan have improved the Infrared Oil Film Monitor operate at heights of up to 30 feet above the wa level. Slicks which seemed to be oil but by che cal analysis were not were discriminated by Monitor in both laboratory and field studies. T instrument provides a simple oil/no oil alarm s requires no attendant or cleaning problems. T possible applications of this instrument inclu baseline studies of coastal oil slicks; monitoring petroleum loading/unloading docks for mi spills; detection of oil which might be released i the environment from waste water storage tan and monitoring for law enforcement purpos suspected oil dumping or seepage areas. URCES AND LEVELS OF MERCURY SEWAGE OF A UNIVERSITY CAMPUS,
Illinois Univ., Carbondale. Dept. of y and Biochemistry.
, G. L. Lundquist, R. G. Webster, R. A. P. C. Lindahl.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 4, p 397-400, April 1975. 1 tab, 9 ref.

Descriptors: *Mercury, *Sewage, *Monitoring, Analytical techniques, Waste water treatment, *Pollutant identification, Water pollution sources, Illinois.

While it has been assumed that mercury pollution originates from industrial sources, other data have indicated that purely domestic sources may also account for mercury levels in sewage. A University campus in Illinois was chosen for analysis of its sewerage. A three-month survey of the total level of mercury from the main outfall sewer of the central campus was made. From an average of 152 trials, a mercury level of 7.9 ppb greatly exceeded the Illinois Pollution Control Board sewer-discharge criterion. The high levels of mercury slugs originated primarily from laboratories which use mercury and its compounds. A program was then established which identified the mercury users on campus and informed these users of a system where the overall-university and individual-building sewer effluents would be monitored for mercury. A central laboratory was designated for reception and treatment of mercury-containing wastes. Following this program, the mean level of mercury was lowered to 0.83 ppb. Sewage solely from student housing contained mercury only slightly in excess of the established background level. Some slugs of mercury in the main-outfall sewer did not correlate directly to slugs from individual buildings; however, subtle sources of mercury occasionally discharged to sewers are as yet undetermined. **A PORTABLE GAS CHROMATOGRAPHIC TECHNIQUE TO MEASURE DISSOLVED HYDROCARBONS IN SEA WATER,**
Nova Univ., Dania, Fla. Physical Oceanographic Lab.
J. P. Perras.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-786 583, $4.25 in paper copy, $2.25 in microfiche. Report No. CG-D-2-75, October 1973. 50 p, 14 fig, 4 tab, 3 ref. DOT-CG-21660-A-3 NEW.

Descriptors: *Analytical techniques, *Gas chromatography, *Oil pollution, Monitoring, Automation, Equipment, Measurement.
Identifiers: Hydrocarbons.

An apparatus and techniques that can be used to determine the presence of alkane hydrocarbons from C-3 to C-6 which are dissolved in an aquatic environment are described. The apparatus is a gas-stripping device which continuously removes hydrocarbon vapors from water and injects them into a gas chromatograph. The gas chromatograph separates and detects the components present in the stripped vapors. Usefulness of this apparatus would be limited in an application to determine the point at which an oil spill is completely removed from the water's surface, because this apparatus depends on the hydrocarbons being dissolved in the water. Once the hydrocarbons are dissolved, they follow the water mass, not the oil on the surface. There is no present knowledge to indicate the exact fate of these volatile hydrocarbons once they become dissolved in the water, but eventually both dilution and volatilization would occur. It would be feasible to install this type of apparatus on appropriate Coast Guard vessels so that surveillance and monitoring could be continuously maintained. In this manner, areas of low level but constant source can be detected even though there is no large, visible oil slick on the water surface. (Jones-Wisconsin)

**USE OF ALGAE, ESPECIALLY DIATOMS, IN THE ASSESSMENT OF WATER QUALITY,**
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
R. Patrick.
In: 'Biological Methods for the Assessment of Water Quality,' 75th Annual Symposium, American Society for Testing and Materials, ASTM Special Technical Publication 528, 1973, p 76-95. 7 fig, 1 tab, 41 ref.

Descriptors: *Algae, *Diatoms, *Water quality, *Bioindicators, Biological communities, Pollutants, Pollutant identification, Eutrophication, Plant physiology, Plant morphology, Bioassay, Statistical methods.

Two approaches have been used in determining if algae can reliably indicate water quality. The first is to observe and analyze natural communities; by shifts in species composition and structure of the community, the effect of a pollutant can be estimated. Data for this type of study are accumulated from autoecology and synecology studies. A second approach is to study a single or a few species in cultures in the laboratory under known and carefully regulated conditions. These studies are valuable in determining the physiological and morphological changes in function rates and polymorphism due to the concentration of a chemical or physical factor. Results may be misleading in precisely estimating how a species will behave in streams, lakes, or estuaries, because the species under laboratory conditions may not be subjected to the combinations of stresses or stimulating factors which occur in nature. To continually monitor a water body to determine if anything is inimical to aquatic life, the best way is to use algal community assays. Algal cells integrate all stresses that might deleteriously affect growth and reproduction or, in a similar way, they integrate all stimulants that may be present. (Jones-Wisconsin)

Some of the frequently asked questions are answered concerning concepts used in establishing the National Stream Quality Accounting Network (NASQAN), its purposes, design, value, and future plans. NASQAN is a series of stations at which systematic and continuing measurements are made to determine the quality of the Nation's streams. Design of the network specifies measurement of a broad range of water-quality characteristics which were selected to meet many of the information requests of groups involved in planning and management on a national or regional scale. The primary objectives are (1) to account for the quantity and quality of water moving within and from the United States, (2) to depict areal variability, (3) to detect changes in stream quality, and (4) to lay the groundwork for future assessments of changes in stream quality. Identifiers: Pollutant flow, Groundwater flow, *Isotope hydrology.

Highlights of the International Atomic Energy Agency Symposium on Isotope Techniques in Groundwater Hydrology are presented. Discussions dealt with environmental isotopes to be used in the studies of the infiltration process, the origin and flow of groundwater, and geothermal systems. Such methods are useful in predicting flow of pollutants discharged into the ground. Possibilities of using 39Ar and 85Kr as research tools are mentioned. The use of artificial radioactive tracers for studies of aquifer characteristics, and development of models for interpretation of tracer data are also discussed. (Prague-FIRL)

D. Fieberg.
Gas-Wasser-Fach Wasser/Abwasser, Vol 115, No 10, p 463-467, October 1974. 8 fig, 5 ref.

Descriptors: Flow, *Measurement, *Waste water treatment, *Biological treatment, *Flow rates, Liquids, Equipment, Treatment facilities, Instrumentation, *Pollutant identification.
Identifiers: *Magnetic flowmeter.

The advantages and uses of magnetic flowmeters in waste water technology are described. Magnetic flowmeters cause no change in the flow cross-section, and the pressure drop generated by them equals that caused by a pipe of identical length. Magnetic flowmeters can be used reliably for the measurement of viscous liquids and liquids carrying solid materials. The readout is linear and is insensitive to voltage fluctuations up to plus or minus 15%. Magnetic flowmeters are designed for flow rates of up to 10 m/sec, with the lowest range between zero and 1 m/sec. Non-conducting deposits on the pipe walls that could falsify the readout may be removed by ultrason or electric shock. Deposits whose conductivity are the same as that of the medium flowing through do not interfere with the measurements. However, magnetic flowmeters should be used in completely full pipes as partial flow falsifies the readout. Magnetic flowmeters can be efficiently used for the control of the waste water and return sludge in biological waste water treatment plants. (Takacs-FIRL)

**A NEW DIRECT ULTRAVIOLET METHOD FOR THE ANALYSIS OF NITRATE IONS,**
J. C. Moore.
Effluent and Water Treatment Journal, Vol 15, No 1, p 17-20, January 1975. 11 fig.

Descriptors: *Nitrates, *Nitrification, *Ultraviolet radiation, Analytical techniques, Ions, Lakes, Waste treatment, Organic compounds, Toxicity, *Pollutant identification.
Identifiers: Brucine sulphate analysis, *Nitrate ions.

A method of direct ultraviolet analysis of nitrate nitrogen is compared with a conventional analysis method which uses brucine sulphate. The brucine sulphate method requires special precautions because of its toxicity, involves precise timing and temperature, and is not accurate in clean water situations because its minimum detectable concentration is 0.18 mg/liter for a one cm path length cell at 410 nm. The ultraviolet method is based on the nitrate absorbance maximum at 203 nm. At concentrations of nitrate ions up to 0.5 mg/liter, the two methods performed identically. However, while stream water from lakes produced excellent results by the direct UV method, the brucine sulphate method was not applicable due to lack of sensitivity. Results were also compared for analysis of influent and effluent of a water pollution control center. The plant utilized activated sludge and trickling filters, reduced organic content by 90%, and accomplished nitrification. Both methods produced similar data; accuracy of the UV method increased with decreasing organ content. Because the direct UV method requir very low organic material, the organic content ma be reduced substantially by preliminary precipit tion with barium hydroxide and zinc sulphate, in proving the applicability of this technique f water analysis. The main disadvantage of t direct UV method had previously been the lack an inexpensive single beam in instrumentation f use at lower wavelengths. Recently, howeve lower wavelengths and a narrower bandpass ha become available. (Prague-FIRL)

**SOME APPLICATIONS OF THERMAL INFRA RED LINESCAN IN WATER RESOURCES STU DIES,**
Water Research Association, Marlow (England).
N. R. Brereton, and R. A. Downing.
Water Services, Vol 79, No 949, p 91-96, Marc 1975. 3 fig, 1 tab, 5 ref.

Descriptors: Groundwater, *Analytic techniques, Discharge(Water), Survey *Groundwater resources, *Remote sensin *Pollutant identification, Regional analysis, Cost Infrared radiation.
Identifiers: *Thermal infra-red linescan, Groun water discharge, Pollutant discharge.

The remote sensing method of thermal infra-r linescan has been applied in several regional st dies concerned with the large scale developme of groundwater resources. These studies we conducted to detect the location of groundwat discharges from the Chalk aquifer into the sea a to assess whether groundwater abstraction from well field had any effect on vegetation or moistu content of the soil. Sewage outfalls with know temperatures and discharges were used as co trols. The method is unlikely to detect spri discharges smaller than 100 liters/s. Groundwat discharges to rivers can be detected if the temper ture difference between the surface water and t groundwater is sufficient to create a recognizab thermal anomaly or if groundwater discharge high enough to not be diluted by the surface wat too rapidly. While the thermal infra-red linesc method was not suitable for small or diffu groundwater flow, the method is most applicab for detection of temperature anomalies in large e panses of water which cannot be economical surveyed from the ground. In coastal surveys, th technique may also be useful for studying the mi ing of river and sea waters and for detecting poll tion. (Prague-FIRL)

criptors: *Waste water treatment, *Analytical niques, *Pollutant identification, Gas chro- ography, Colorimetry, Chromatography, rination.
tifiers: Carcinogens, *Benzidine.

zidine (4,4'-diaminobiphenyl) has been in- ed on the Occupational Safety and Health Ad- stration's list of chemical carcinogens. Results observations are reported on the development alytical procedures for the determination of idine in the ppb range in waste waters such as sewage, secondary effluents, rivers, and in- rial wastes. Waste water samples from the Los eles County area were routinely spiked with vn amounts of benzidine/methanol standards. treated samples were then subjected to a sam- retreatment procedure followed by colorimet- GLC, or TLC analysis. Pretreatment involved tment to pH 11, extraction of the filtrate with yl ether, extraction of ether phase with 2N neutralization of acid phase with 10N NaOH, his stage colorimetric analysis could be per- ed), extraction of aqueous phase with diethyl ether, and concentration of ether phase, (at this stage the GLC and/or TLC analysis can be performed). The GLC analysis is sensitive and selective for benzidine and is preferred over the colorimetric or TLC analysis. The overall detection limit of the analysis is determined by the initial sample size and the volume of the final concentrate. The practical detection limit was in the range of 2-3 micrograms/liter. In unchlorinated waste waters, the experimental spike recoveries ranged between 70-95%. However, low recoveries were realized from chlorinated waste waters spiked with benzidine. The low recoveries are apparently due to the reaction of benzidine with hypochlorous acid to produce a chloramine type structure. The described analytical methods should be suitable for the determination of other carcinogenic anilines in waste waters. (Orr-FIRL)

ESTIMATES USING FLUORESCENCE SPECTROSCOPY OF THE PRESENT STATE OF PETROLEUM HYDROCARBON CONTAMINATION IN THE WATER COLUMN OF THE NORTHWEST ATLANTIC OCEAN,
Bedford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
D. C. Gordon, Jr., P. D. Keizer, and J. Dale.
Marine Chemistry, Vol 2, p 251-261, 1974. 1 fig, 2 tab, 24 ref.

Descriptors: *Oil pollution, Canada, *Spectroscopy, Surface waters, *Atlantic Ocean, Data analysis, Sea water, Sampling, Fluorescence, Organic compounds, *Pollutant identification.
Identifiers: *Fluorescence spectroscopy.

Recent attention has been given to determining the magnitude and variability of petroleum hydrocarbon concentrations in and on seawater. Sampling was done from cruises in the water column of the northwest Atlantic Ocean between Nova Scotia and Bermuda, Canada. Fluorescence spectroscopy was used to estimate petroleum hydrocarbons concentrations. In surface water (0 to 3 mm) concentrations averaged 20.4 micrograms/liter; in water from 1 to 5 m they averaged 0.8 to 0.4 micrograms/liter. No significant concentrations were detected in deeper water. Variability indicated that distribution of oil in seawater is very patchy, particularly for surface waters. Due to adsorption problems seawater samples for hydrocarbon analysis cannot be collected by conventional sampling methods. The inner surfaces of the samplers must come in contact only with the water being sampled and must be rinsed with organic solvent after samples are removed. For this reason, previous work in the data analysis of seawater hydrocarbons should be re-examined. (Prague-FIRL)

Fluorescence spectroscopy has been used to identify petroleum that has been spilled into the water and has become deposited in the sediments. Application of the fluorescence method for estimating oil in water, sediments and organisms requires that fluorescence be related to a standard. Wavelengths for measurement are chosen by scanning excitation and emission spectra and identifying peaks. Total oil concentrations are not measured, only inferred, and the use of such calibrations assumes that all fluorescence in samples is attributable to the presence of fluorescing compounds equivalent to those in the petroleum standard. A procedure for extracting aromatic containing compounds from sediments was developed in the present study. Fluorescence contour diagrams were constructed and used to compare fluorescence patterns in n-hexane extracts of samples and standard oils. This procedure permits more accurate estimates of total oil concentrations to be made by ensuring that fluorescing compounds observed in sample extracts are derived from petroleum. Similarities in spectral contour diagrams showed the presence of petroleum residues in beach sand from Bermuda, inter-tidal sand and sedimenting material from an inlet near an oil refinery in Nova Scotia, and in sand from Chedabucto Bay contaminated by the ship, Arrow, stranding in 1970. Total oil concentrations ranged from 10-3000 micrograms/gram wet sediment. Fluorescence patterns in many sample extracts did not resemble any standard oil, indicating the presence of material which did not originate from fresh petroleum. (Orr-FIRL)

THE INFRARED STUDIES OF SANTA BARBARA CHANNEL OIL SPILL,
Cincinnati Univ., Ohio.
T. Tu-Ching.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106, Order No. 74-26,406. Ph.D. Thesis, 1974. 136 p.

Descriptors: *Oil spills, *Oil wells, *California, *Pollutant identification, *Infrared radiation, Analytical techniques, Organic compounds, Water pollution effects, *Path of pollutants.
Identifiers: Internal reflection spectroscopy(IRS), Santa Barbara Channel(Calif).

A twelve-month study was carried out to evaluate the effects of a spill from an oil well in Santa Barbara Channel, in southern California, which occurred January 28, 1969. The study evaluated infrared analytical techniques for qualitative identification of different oils and establishment of background levels of hydrocarbon control of marine sediments; studied the movement and deposition of oil both from the spill and from natural seeps in the Santa Barbara Channel; investigated the effect of the size and nature of the sediment on the movement of oil; and correlated the oil movement with sediment formation and movement and natural current patterns. Internal reflection spectroscopy (IRS) was used to analyze 374 samples which had previously been studied by the IR transmission technique. Different mineral composition of sediments was found to complicate the quantitive determination of oil. Conflicting results were discovered in some cases on the composition of sediments by x-ray diffraction methods and by IRS spectra methods; theoretical analysis showed that phosphate was the major constituent of the sediments. In addition, the study of the surface active agent, considered as a pollutant, and its effect on the crystal nature of hydroxyapatite precipitates was presented. (Prague-FIRL)

**FORECASTING WATERSHED POLLUTION USING A MODEL,**
Adaptronics, Inc., McLean, Va.
A. N. Mucciardi.
Water and Sewage Works, Vol 121, No 8, p 58-59, August 1974. 2 fig, 8 ref.

Descriptors: *Model studies, Watersheds(Basins), Pollutants, Water pollution, Bacteriophage, Coliforms, *Forecasting, *Pollutant identification, *Path of pollutants.
Identifiers: *Adaptive Trainable Network, *Pollutant forecasting, Non-linear multivariate forecasting model.

A model for forecasting the pollutants in watersheds is explained that overcomes the difficulties experienced with conventional analytical models. The technology in Adaptive Trainable (Learning) Networks places no reliance on prior assumptions; the modeling can provide solutions from a very limited data base; and, the methodology provides accurate forecasts many times farther into the future than previously realized. The Adaptive Trainable Network modeling techniques were used to forecast the total bacteriophage concentration in the Potomac River as a function simply of environmental variables such as river flow rate, river staging, tide levels, precipitation, and average daily temperature. Four ALN forecasting models were constructed: 3-day forecast; 6-day forecast; 9-day forecast; and, 12-day forecast. The networks were able to make forecasts with an average accuracy of 95.2% throughout a 12-day forecasting period. The key to developing nonlinear multivariate forecasting models is the ability to train an adaptive learning network model. The ALN modeling procedure not only determines the proper linear and nonlinear structure of the model, but also the relevant or most discriminatory variables are identified. The subset of relevant variables is ranked with respect to discriminatory ability as a byproduct of the ALN training exercise. An explanation of how to develop the model as well as the description of the Potomac River exercise is given. (Orr-FIRL)

**ROUTINE SURVEILLANCE ALTERNATIVES FOR WATER QUALITY MANAGEMENT,**
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
R. C. Ward.
Journal Water Pollution Control Federation, Vol 46, No 12, p 2645-2652, December 1974. 18 ref.

Descriptors: *Pollutant identification, *Water quality, Management, *Monitoring, Automation, *Remote sensing, *Sampling, Spills, Pollutants, Measurement, Costs, Personnel.
Identifiers: *Automatic monitoring, *Grab sampling, Data needs, Cost-effectiveness.

Three techniques of routine surveillance for water quality management are reviewed: grab sampling, automatic monitoring, and remote sensing. While grab sampling has been the traditional method of water quality analysis, it has the limitations of being unable to detect rapidly changing water quality conditions, such as spills, and of being unable to identify the source of an extreme. There has also developed a need for data acquisition with a large spatial coverage. The answer in time coverage is automatic monitoring and in space coverage is remote sensing. For best sampling, all three techniques in combination are needed. Cost, personnel, and data needs are factors to be considered in augmenting a traditional grab sampling system with the other two techniques. Data needs are dependent upon the pollution control strategy used and the character of the stream, both natural and as affected by population and effluent discharges. The cost-effectiveness of each system as applied by Colorado State University for both detection of spills and routine monitoring of pollutants is discussed. Management programs must concentrate on planning for automatic monitoring and remote sensing relative to the needs and the goals of each individual agency. (Prague-FIRL)

**MONITORING THE QUALITY OF SURFACE WATER,**
Philips Gloeilampenfabrieken N.V., Eindhoven (Netherlands).
D. J. Kroon, and M. Q. Mengarelli.
Philips Technical Review, Vol 34, No 5/6, p 113-122, 1974. 7 fig.

Descriptors: *Pollutant identification, Design critera, *Surface water, *Monitoring, Water quality, Automation, Measurement, Eutrophication, Oil spills, Computers, Mathematical models.

The design of a system for monitoring the quality of surface water is described. Ideally a combination of manual and automatic measurements is optimal. Such a system should provide prompt information about a number of simple physical and chemical parameters, relating to oxygen balance and eutrophication, concentrations of malodorous components, mineral oils, oil slicks, phenols, certain trace metals, and organic micropollutants. Monitoring systems in an automatic network may measure only one or two parameters or may measure a large number of parameters. The first type is best situated at discharge sites and at the boundaries of a monitored area for which a mathematical model has been composed. A central computer can then be programmed with this model and immediately warn of unusual pollutants and a dangerous situation further downstream. For example, should an oil spill occur, an analysis of floating oil, oil in emulsified form, as well as oil in dissolved form should be measured. Knowledge of the composition of the spill, its sulphur content, and presence of any trace metals (such as vanadium) makes it possible to often establish the origin of such a discharge. In addition, a third type of monitoring station should check the accuracy of the data obtained in measuring water quality. A water monitoring station developed by Philips is detailed, which operates along the river Lambro, near Milan, Italy. (Prague-FIRL)

**HOW MUCH 'RELIABILITY' IS 'ENOUGH',**
A. G. Linowiecki, and J. D. Lydick.
Offshore, Vol 35, No 2, p 240, 242-244, 247, February, 1975. 4 fig, 1 tab.

Descriptors: *Pollutant identification, *Monitoring, *Costs, Water pollution control, Design criteria, Wells, Mathematical models, Systems, Oil pollution.
Identifiers: *Hydrocarbon pollution.

Costs and reliability of hydrocarbon pollution monitoring are discussed. Subsea well control and monitoring systems should help operators maximize hydrocarbon production with minimum total cost, consistent with safety and pollution control requirements. The methods detailed can be used for various types of equipment and systems and are useful in offshore and subsea applications which involve high costs of lost production and perhaps difficult maintenance. Mathematical relationships are shown for reliability of a pollution control system. The failure rate of a system may be determined by: design with appropriate str margins; design verification for the specific ap cation; and employment of proven procedur trained experienced personnel, and discipline organization. Control system costs are affected ability to control the well, ability to provide use and reliable information about well performan and operating conditions, pollution control ca bilities, safety capabilities, and availabili (Prague-FIRL)

California Univ., Davis. Dept. of Mechanical E gineering.
J. W. Brewer, and S. F. Moore.
Journal of Dynamic Systems, Measurement, a Control, Vol 96, No 3, p 363-365, September, 19 1 fig, 1 tab, 12 ref.

Descriptors: *Design criteria, *Model studi *Monitoring, *Water quality contr *Mathematical models, Environmental conditio Water quality standards, Performance, Regu tion, Reliability, *Pollutant identification.
Identifiers: *Monitoring system design.

A water quality monitoring system is needed society. These monitors serve as estimators whi minimizes the cost of taking measurements a which simultaneously meets constraints on acc racy. The development of a monitor theory w improve environmental technological syste design. Monitor synthesis can be divided into t subproblems. The design problem consists selecting the variables for measurement, selecti the measurement devices, and selecting the spat distribution of the devices. The manageme problem consists of choosing, on line, the type a sequencing of measurements. A simulated applic tion of filter theory to the management of a wat quality monitor is presented. It is shown that a s boptimal minimum cost monitor can be synthe ized by the proper sequencing of costly measur ments. However, optimum modeling continues be a problem of much theoretical interest whi requires more investigation. (Orr-FIRL)

na State Univ., Bozeman. Dept. of Chemis-

arwell, F. A. Beland, and R. D. Geer.
ical Chemistry, Vol 47, No 6, p 895-903, 975. 4 fig, 2 tab, 34 ref.

ptors: *Pollutant identification, *Analytical ques, *Instrumentation, *Polychlorinated yls, Water pollution sources, Pollutants, ent, *Volumetric analysis.
ers: *Polychlorinated naphthalenes, lorinated hydrocarbons.

e of interrupted-sweep voltammetry for the cation of polychlorinated hydrocarbons by eristic current-voltage patterns and inter- tential data was demonstrated. The inex- instrumentation developed for this identification is particularly advantageous in obtaining rapid and reproducible voltametric data when the chlorinated hydrocarbon reduction waves overlap.. The theoretical basis, design, operation, and 'fingerprinting' capability of the equipment are discussed. The several important features of the interrupted-sweep technique that make it especially effective in the fingerprint identification of chlorinated hydrocarbons include: automatic control of the applied waveform by the reduction behavior of the sample; high resolution peaks; and, the relatively low cost of the integrated circuit instrumentation. Characteristic voltammetric fingerprints and reduction potential data were obtained for 31 polychlorinated biphenyls and 37 polychlorinated naphthalenes. Only two of the compounds could not be positively identified using this technique. (Orr-FIRL)

**WATER MONITORING IS BIG BUSINESS.**
Water and Pollution Control, Vol 112, No 9, p 14, September, 1974.

Descriptors: *Monitoring, *Water analysis, *Water quality control, *Analytical techniques, *Canada, *Pollutant identification, Chemical analysis, Sampling, Water sampling.

Monitoring Canada's lakes and rivers in a multi-million dollar proposition. A national network of over 600 fixed sampling stations are operated to assess the state-of-health of lakes and rivers and to show trends in water quality. Samples taken which are considered representative of the entire water system are analyzed for about 90 parameters which are then used to evaluate water quality. Specific tests are conducted to describe important basic conditions such as dissolved oxygen content and pH, indicative of the general health of a particular body of water. Identification and monitoring of trace metals is performed to guard against toxic conditions and effects. Equipment such as the AutoAnalyzer and the atomic absorption spectrophotometer have greatly reduced the time required for an analysis of trace metals. The Canada Centre for Inland Water laboratory is responsible for operating a quality control program to ensure reliability of data and for developing new analytical procedures and techniques. The data from the past ten years of sampling are being interpreted for water quality reports for each province. After the report is finished for a province, bi-annual water quality reports will then be published to inform the public of improvements or setbacks in the aquatic environment. (Orr-FIRL)

**DEVELOPMENT PROGRESS WITH SALWICO POLLUTION MONITORING SYSTEM.**
Marine Week, Vol 2, No 5, p 26, January 31, 1975.

Descriptors: *Oil wastes, *Oil spills, *Water pollution control, *Monitoring, Analytical techniques, Pumps, Equipment, *Pollutant identification.
Identifiers: Oil density measurement.

An oil pollution monitor has been developed by a Swedish company in order to monitor all normal black and white oils without need for individual setting or calibration. This Salwico monitor, from Salen and Wicander AB, concentrates the oil before scanning it for discoloration and gas evaporation. A rated flow of sample water is fed through a filter band and moved at a constant velocity. The oil density per area unit of the band is thus a direct function of the oil content in the water. Discoloration of the filter band is measured by a photo cell directly after exposure to the sample water; two signals given are added together, giving a minimum spread between different oils. The equipment is built into one analyzer unit and one control indicator panel. The latter is mounted in a cargo control room while the analyzer contains the wet compartment with pumps and piping, and is either mounted in a small deck cabinet or in the pump casing bulkhead. As pollution control equipment, the monitoring system has now been tested and put into series production. (Prague-FIRL)

**ANALYZING ORGANICS IN DILUTE AQUEOUS SOLUTIONS,**
Oak Ridge National Lab., Tenn.
R. L. Jolley, S. Katz, J. E. Mrochek, W. W. Pitt, Jr., and W. T. Rainey.
Chemtech, p 312-318, May, 1975. 4 fig, 5 tab, 36 ref.

Descriptors: *Analytical techniques, *Organic compounds, *Domestic wastes, *Industrial wastes, *Pollutant identification, Chromatography, Ion exchange, Mass spectrometry, Gas chromatography, *Organic wastes, Aqueous solutions.
Identifiers: Ultraviolet spectrophotometry.

To evaluate the possible consequences of the discharge of organic compounds from domestic and industrial sewage treatment plants, an integrated, multicomponent analytical procedure for the quantitative determination of organic constituents in the microgram/liter range in complex aqueous solutions has been developed. The method utilizes high resolution chromatography for separation followed by sequential use for identification of ion exchange chromatography, UV spectrophotometry, gas chromatography, and mass spectrometry. The automated high resolution liquid chromatographs were initially developed Oak Ridge National Laboratory. They have been successfully used for separating and detecting over 100 UV absorbing constituents from sewage effluents. In this case, 36 compounds were identified in the primary effluent sample tested; over 70 constituents were partially characterized. Nine compounds were identified in one sample of secondary effluent. (Orr-FIRL)

**FINITE ELEMENT MODELING OF FLOW THROUGH POROUS MEDIA,**
State Univ., of New York, Buffalo. Faculty of Engineering and Applied Sciences.
R. T. Cheng.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 750, $4.75 in paper copy, $2.25 in microfiche. Dept. of Civil Engineering, Water Resources and Environmental Engineering Research Rept. No. 75-2, March 1975. 87 p, 6 append. OWRT C-4026 (no.9006) (4).

Descriptors: *Aquifers, *Dispersion, *Computer models, Simulation analysis, *Sea water intrusion, Path of pollutants, Interfaces, Groundwater, Porous media, Flow, Computer programs, *Finite element analysis.
Identifiers: Finite element models.

Findings of an investigation into the application of the finite element method to certain ground water flow problems are presented followed by reproductions of five articles from the published literature originating from the study and an appendix containing a computer subroutine package for solving the convective-dispersion material balance equation using quadratic isoparametric finite elements. The published articles deal with the development of the basic theory for the finite element method as applied to ground water flow as well as basic schemes for application of the method. The results of this development are applied to the problem of sea water encroachment in coastal aquifers, brine movement through causeways, and dispersion of pollutants in ground water flows. The intrinsic generality of the finite element method for solution of the convective-dispersion equation allows the computer program to be applicable to a large class of problems. Only a set of new data which describe the region of interest, discretization, initial and boundary conditions are required to initiate the computations on a fresh problem. The included subroutine package was found to be the most efficient scheme for handling a class of initial-boundary value problems containing both a phreatic surface and a density stratified interface.

**RADIOACTIVITY FROM SRP OPERATIONS IN A DOWNSTREAM SAVANNAH RIVER SWAMP,**
Du Pont de Nemours (E.I.) and Co., Aiken, S.C. Savannah River Lab.
W. L. Marter.
Available from NTIS, Springfield, Va. 22161 as Rept. No. DP-1370, $5.45 in paper copy, $2.25 in microfiche. Rept. No. Dp-1370, September 1974. 51 p, 16 fig, 15 tab, 3 ref, 3 append.

Descriptors: *Radioactivity, *Swamps, Costal marshes, Deposition(Sediments), Cesium, Cobalt, Strontium, Nuclear reactors, Nuclear wastes, Clays, Flooding, Water pollution, Fish, Regulation, *South Carolina.
Identifiers: *Savannah River(SC).

Approximately 25 curies of cesium 137, less than 1 curie of cobalt 60, and trace amounts of strontium 90 were deposited in about two square miles of swamp bordering the Savannah River and adjacent to the southeast Savannah River Plant boundary. Most of the radioactivity was released to on-site streams in the 1960's from reactor area irradiated fuel storage basins. During the period of release, annual average cesium 137 concentration in onsite streams never exceeded 3.0% of the concentration guide of 0.00002 Micro Ci/ml, and concentrations in the Savannah River never exceeded 1% of the guide. Most of the radioactivity in the offsite swamp is associated with kaolin clay particles deposited in the swamp during river flooding which occurred about 23% of the time each year. Gamma exposure rates in the affected area of the off-site swamp range from 30 to 590 mR/year above background. The swamp is uninhabited, and the most likely incremental radiation dose (above background) to hunters and fishermen who spend from a few hours to several hundred hours in the swamp would range from less than 1 mR to a few tens of mR per year. No restrictions on use of the swamp are considered warranted nor are remedial actions needed. (Houser-ORNL)

**A MODEL FOR PREDICTING THE EFFECTS OF SEWAGE EFFLUENT ON WETLAND ECOSYSTEMS,**
Michigan Univ., Ann Arbor.
K. R. Dixon.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106, Order No. 74-25,187. Ph.D. Thesis, 1974. 120 p.

Descriptors: *Marshes, *Ecosystems, *Mathematical models, *Sewage disposal, *Environmental effects, Computers, Simulation models, Nutrients, *Forecasting, Wetlands, Water pollution sources.

A mathematical model was formulated to forecast the effects of sewage waste water disposal on the ecosystem. The model consists of a set of ordinary, first-order non-linear differential equations which represent the mass balance of the biomass components of the system. The CSMP simulation language is used and operated on a digital computer. Sensitivity analyses for unit variables relating to waste water disposal such as water and nutrients were made. Sensitivity was defined as the percentage change in the unit variable due to a 50 percent change in a parameter during a one-year simulation. For example, of the variables, nutrients have a greater effect on litter decomposition than the amount of water covering the litter. Long-range stability of the model was determined. The model is useful for making decisions about the feasibility of using a particular wetland ecosystem for waste water disposal. Forecasts for an individual marsh ecosystem are possible when data are actually collected from the marsh study area. In this manner, parameters related to added water and nutrients can be varied to give the projected simulation. (Prague-FIRL)

**A GENERAL LINEAR APPROACH TO STREAM WATER QUALITY MODELING,**
IBM Federal Systems Div., Gaithersburg, Md.
M. Arbabi, and J. Elzinga.
Water Resources Research, Vol 11, No 2, p 191-196, April 1975. 1 fig, 3 tab, 14 ref.

Descriptors: *Water quality, *Dissolved oxygen, *Mathematical models, Oxygen sag, *Linear programming, *Costs, Streams, Analytical techniques, Water quality control, *Path of pollutants, Model studies.
Identifiers: Pollutant discharge.

Techniques are presented for formulating stream water quality models which attempt to meet dissolved oxygen standards while optimizing some function of individual pollution abatement costs. New properties of the oxygen sag equation allow the constraint set of such mathematical programs to be described to a high degree of accuracy by linear inequalities. With the exception of upper and lower bounds on pollutant discharges, three linear constraints at most are required per reach. With simple constraint elimination techniques, the size of mathematical programs is reduced, making analysis of large-scale stream quality models feasible. For cases where the cost functions are linear or piece-wise linear convex, the analyst may utilize linear programming and its ancillary methods of duality implications, sensitivity analysis, parameterization, chance constraint, and decomposition. For cases where cost functions are not linear or in which variables are discrete, the problem solution may be easier with the presence of linear constraints. (Prague-FIRL)

tion of ground-water pollution problems
carried out in six states in the northwest:
Idaho, Montana, Oregon, Washington
ning. With the exception of radioactive
posal, few cases of ground-water pollu-
been investigated in detail. There is a
baseline water-quality data and syste-
luation of overall ground-water condi-
ecially in urbran zones, in areas of
exploration and development, and at lo-
mining and industrial activity. The most
natural ground-water quality problems,
high salinity, are excessive hardness,
ganese, and fluoride. Principal sources
used ground-water quality problems in
imate order of severity are: discharge of
om septic tanks and sewage treatment
igation return flow, dryland farming,
oil wells, shallow disposal wells, un-
ace impoundments, mine tailings and
age, municipal and industrial landfills,
ctive waste disposal. Other sources that
be of less importance but still must be
include: spills and leaks, application of
nd pesticides, feedlots, and salt-water

This study analyzes the environmental impact of using sanitary landfills for disposing of solid waste. The relevant economic theory concerned with the measurement and valuation of external effects is developed and previous empirical impacts of various activities are reviewed. Both the theoretical and empirical evidence suggests that the costs and benefits of external effects are extremely difficult to measure directly but under certain circumstances property value studies can be used to obtain indirect estimates. A survey of the technology of sanitary landfills suggests that a properly designed fill will cause very little air and water pollution, but may impose visual and noise pollution on nearby residents. These hypotheses are tested with data on property surrounding four sanitary landfills in los Angeles County. A model of the determinants of residential property values is formulated and estimated. The model includes variables which describe the characteristics of the property and variables which describe the relationship of the property to the fill. Statistical estimates of the parameters of the model indicate that proximity to and view of a sanitary landfill do not significantly reduce the market or assessed value of surrounding property. (EPA)

Identifiers: Waste discharge, Leachout, Sanitary landfills.

The problem of groundwater contamination due to infiltration and leachout from waste dumps and sanitary landfills is discussed, and guidelines for the selection of landfill sites are presented. Waste dumps and sanitary landfills may present a hazard of groundwater contamination by inorganic and organic materials, but very little hazard of biological contamination. Sanitary landfills should be established in areas protected from inundation and with a low groundwater table level, or where an aquifer has good self-purification possibility. Therefore, porous aquifers are generally more suitable than karstic and fissurized rockbed. If the self-purifying capacity of an aquifer is limited, the waste disposal site should be made impervious by applying a layer of clay or plastic film. Also, sites with low groundwater flow rates are preferable. (Takacs-FIRL)

Identifiers: Chemical tracers, Radioactive tracers, Fluorescent tracers, Pollutant dispersion.

Chemical, radioactive, and fluorescent tracers and their uses in general hydrological and water pollution studies are reviewed. Compounds of chromium, sodium, cobalt, indium, and tantalum are among the most frequently used chemical tracers. The most common radioactive tracers are 82Br, 130I, 192Ir, 182Ta, 51Cr, 198Au, and 110Ag. Fluorescent tracers, such as rhodamine-B, rhodamine-WT, and fluorescein, emit visible light due to the effect of UV irradiation. A literature review of studies and experiments using tracers is presented. Tracers are particularly suitable for the study of flow and dispersion processes in water, as well as the study of the dilution and general behavior of water pollutants. (Takacs-FIRL)

Identifiers: Industrial indicators.

Included was a general definition of groundwater, its value to society and the imminent dangers it faces. The protection of this valuable resource is vital; hence, indicators of potential polluters were examined and possible methods for preserving the quality of subsurface water were presented. The material for this study was drawn from three geographical regions of the United States and includes specific looks at pertinent problems in Louisiana and Nevada as well as some interesting case histories from the northeast section of the country. Investigations were recommended to study the movement, fate, and effect of pollutants in subsurface waters including to the extent and nature of native microbial activity as well as microbe-pollutant interactions in subsurface regions receiving pollutants. The ultimate objective should be the development of information needed for defining the capacity of subsurface regions as pollutant receptors and, hence, for predicting the probable impact on groundwater of activities entailing the release of pollutants into the earth's crust. NUMERICAL MODEL OF THE SALT-WEDGE REACH OF THE DUWAMISH RIVER ESTUARY, KING COUNTY, WASHINGTON,
Geological Survey, Tacoma, Wash.
E. A. Prych, W. L. Haushild, and J. D. Stoner.
Open-file report 75-13, 1975. 93 p, 29 fig, 13 tab, 53 ref, 2 append.

Descriptors: *Path of pollutants, *Estuaries, *Washington, *Model studies, Numerical analysis, Saline water intrusion, Sewage effluents, Water temperature, Dissolved oxygen, Biochemical oxygen demand, Phytoplankton, Tracking techniques, Tidal effects, Water pollution sources, Salinity, Chlorophyll.
Identifiers: *Duwamish River estuary(Wash).

A numerical model (calibrated and verified with observed data) of a salt-wedge estuary was used to calculate the distributions of salinity, temperature, chlorophyll a concentrations, biochemical oxygen demand, and dissolved-oxygen concentrations in the Duwamish River estuary, King County, Wash. Dissolved-oxygen concentrations were predicted in the estuary when sewage-effluent discharge is increased to its proposed maximum of 223 cubic feet per second. The computed monthly average dissolved-oxygen concentrations in the estuary decreased by a maximum of 2 mg/litre when compared with computations for the summer of 1971, when the effluent discharge averaged 37 cubic feet per second. The increase in effluent discharge is not expected to cause large changes in phytoplankton concentrations in the estuary. (Woodard-USGS)

Identifiers: *Everglades National Park(Fla), Conservation areas.

The term 'Everglades basin' as used in this report extends from Lake Okeechobee in the north, southward through Everglades National Park. It is bordered on the west by the Big Cypress Swamp and on the east by agricultural lands and rapidly expanding urban areas. Within the Everglades basin are three water conservation areas utilized for water storage and recreational use. From July 1972 to June 1973, 78% (5,200 metric tons) of the total nitrogen and 90% (207 metric tons) of the total phosphorus entering the conservation areas was contributed by bulk precipitation (rainfall and dry fallout). Controlled and noncontrolled surface-water discharge contributed the remainer: 22% (1,460 metric tons) of total nitrogen and 10% (22.4 metric tons) of total phosphorus. Of the water lost, 53% was by seepage and 47% by surface-water discharge. About 5,000 metric tons of total nitrogen and nearly 220 metric tons of total phosphorus were apparently retained within the conservation areas. This retention constitutes 74% of the total nitrogen and 96% of the total phosphorus that entered the conservation areas from July 1972 to June 1973. (Woodard-USGS)

Water-Resources Investigations 7-75, April 1975. 34 p, 4 fig, 4 tab, 11 ref, append.

Descriptors: *Waste disposal, *Liquid wastes, *Solid wastes, *Underground waste disposal, *Water quality control, *California, Injection wells, Fuels, Waste storage, Groundwater movement, Hydrogeology, Arid lands, Hydraulic conductivity, Path of pollutants, Sampling, Hydrologic data, Chemical analysis, Test wells.
Identifiers: *Rocket propellant wastes, *Edwards Air Force Base, Class-I wastes.

Edwards Air Force Base (EAFB), Calif., is northeast of Lancaster in the Mojave Desert. The primary function of EAFB is experimental flight and rocket testing. The Haystack Butte area is used primarily for the testing of rocket propellants. Waste products of the testing are solid and liquid rocket propellants and contaminated soils and metals. In the past these wastes have been containerized, placed in abandoned mine shafts, burned, exploded, or removed from EAFB by civilian contract for disposal in other areas. This report appraises the climatic, geologic, and hydrologic conditions for possible discharge of Class-I wastes, and evaluates the effects of previous disposal of solid and liquid wastes into abandoned mine shafts. Class-I waste disposal sites are those at which complete protection is provided for all time for the quality of ground and surface waters from waste dposited therin and against hazard to public health and wildlife resources. Although usable groundwater does not exist in the area investigated, the groundwater affected by the discharge of Class-I wastes could at some future time affect potentially usable groundwater outside the study area. (Woodard-USGS)

LOW-FLOW CHARACTERISTICS OF WISCONSIN STREAMS AT SEWAGE-TREATMENT PLANTS,
Geological Survey, Madison, Wis.
W. A. Gebert, and B. K. Holmstrom.
Water Resources Investigations 45-74, December 1974. 101 p, 2 fig, 32 tab, 34 ref.

Descriptors: *Low flow, *Wisconsin, Waste dilution, Waste water disposal, Water pollution, Base flow, Streamflow, Treatment facilities.

Low-flow characteristics of Wisconsin streams at 415 sewage-treatment plants are presented. The low-flow characteristics are the annual minimum 7-day mean flow that occurs on the average of once in 2 years and the annual minimum 7-day mean flow that occurs on the average of once in 10 years. The low-flow characteristics were determined by correlating base-flow measurements at the sewage-treatment plants to the concurrent daily mean flow at continuous-record gaging stations in the area. The accuracy determined by the standard error of estimate for the 10-year low flow ranged from 18 percent at continuous-record gaging stations to 70 percent when only three flow measurements were available. ARSENIC IN SEDIMENTS ON THE CONT TAL SHELF OF SOUTHEAST AUSTRALI
Bureau of Mineral Resources, Geolog Geophysics, Canberra (Australia).
P. J. Davies.
Search, Vol 5, No 8, p 394-396, August 1974 2 tab.

Descriptors: *Arsenic compounds, *Sedime tribution, *Municipal wastes, *Industrial w Sediments, Sedimentology, Sediment-water faces, Agricultural runoff, Agricultural chem Water pollution sources, Effluents, *Aus *Continental shelf, Pollutant identification.

Arsenic was discovered in the shelf sedime southeast Australia as a result of a reconnais geological survey conducted during 1972. T senic contents in the shelf sediments were two orders of magnitude higher than tho ported for average shale, sandstone, limestone. The maximum arsenic concentr occur offshore from areas of major urban a dustrial development, and not offshore agricultural areas. Support for the suggestio the arsenic is deposited as the result of urba lution comes from another study showing t creasing concentrations of arsenic in the K River due to pollution by detergents us household washing. Arsenic is enriched in th face sediments of the continental she southeast Australia, particularly between Kembla and Newcastle, where concentratio 50-100 ppm are common. The arsenic m derived from the natural erosion of rock, or urban and industrial effluents. The complex arsenic with colloidal manganese comp results in its deposition in the quieter areas middle to outer shelf. A series of sediment drilled in the areas of high arsenic concentr could be analysed to determine whether the arsenic values are due to modern urban/indu effluents, or related to natural concentr mechanisms coupled with non-sediment (Orr-FIRL)

Identifiers: Land disposal.

ry landfill criteria have been reexamined by ffice of Solid Waste Management Programs. l damage cases show that groundwater rces are threatened by pollutants leaching dumps. Two examples were a dump in Conut which caused the wells of about 50 subon homes to be contaminated, and a more s case in Delaware in 1972 where a dump in ndoned sand and gravel pit allowed an unund plume of leachate to envelop one well f a water company serving 80,000 people. ial measures in both cases were costly. The l definition of sanitary landfill includes apon of daily cover, no burning, waste not directly into groundwater, and no visible on of surface water. However, the problem hates entering unseen into groundwater is ex. Leachate forms when water percolating h solid waste flushes out compounds and products of decomposition. Site charac- s for determining safe sanitary landfill depon evaluation of: depth from the bottom of to the maximum height of groundwater; on and flow rate of groundwater; present ture groundwater demands; analysis of ung soils and geology including texture, bility, structure, and stratigraphy; topogelated to surface drainage; and net infiltraommunities should plan for disposal capacit least five years into the future. Existing ould be monitored to avoid costly cleanup es. (Prague-FIRL)

ly, a stochastic model of a dynamic, onenal eutrophic estuary was developed; it wn that this model could be formulated deterministic counterpart with the addi- single new parameter. Herein, the determodel upon which the stochastic model d is developed and explained. The deriva- of sufficient generality to permit any f components and any reasonable system tion to be handled. All system parameditions, and forcing function could be s functions of time (not just tidal phase), and if necessary, other factors. ations have been made in: the difequations which are solved; the initial ndary conditions used; the manner in e physical conditions of cross-sectional ht intensities, freshwater flow rate, land enthal demand, and water temperature, d turbidity are handled; the number of components considered; and the use of time and position variable parameters and conditions. This deterministic model is more general and realistic than any previous estuary model. Its solution is twice as fast as that for the much simpler BOD-OD model. Recommended are use of the model by operating and design personnel and further verification of both the deterministic and stochastic models. (Bell-Cornell)

Identifiers: *Mass balance.

Phosphorus dynamics in a small river system have been measured to determine phosphorus transport mechanisms and correlation with hydrodynamic phenomena. Variation of chemical forms with flow conditions are related to point and diffuse sources and general equations are derived. Mass balances are developed and diurnal changes are described. Investigation into the phosphate dynamics of the Brandywine River during the summer of 1972 indicates that phosphate transport occurs by two different mechanisms depending upon the type of flow found in the river. For steady flow, phosphate concentrations exhibit the dilution effect. During unsteady stage flow, phosphate concentrations tend to increase with increasing water flow rate. (Bell-Cornell)

Chiba Univ. (Japan). Research Inst. for Chemobiodynamics.
K. Fujiwara, T. Sugyama, K. Koike, and K. Oba.
Nippon Eisei gaku Zasshi, (Japanese Journal of Hygiene), Vol 29, No 6, p 552-557, February 1975. 6 fig, 4 tab, 14 ref.

Descriptors: *Biodegradation, *Model studies, *Organic compounds, *Linear alkylate sulfonates, Rivers, Surfactants, Detergents, Water pollution sources, *Path of pollutants, *Pollutant identification.
Identifiers: Methylene blue, Ultraviolet spectrophotometry.

A river model for measuring the biodegradability of organic materials has been developed which simulates the natural aquatic environments. By using this model, the biodegradability of linear alkylate sulfonates (LAS) was determined by using methylene blue and UV spectrophotometry to detect the presence of LAS. LAS which was added to produce a concentration of 10 ppm was shown to be removed almost completely in twenty days from the water fractions and bottom sludge layers by determination with methylene blue. The UV spectrophotometry revealed a residue of about 40% in water fractions and about 25% in the bottom sludge layers even after the 20 day period. The discrepancy of these biodegradabilities might be due to the difference between the principles of the determination methods. The rate of biodegradation of LAS compounds containing alkyl chains in the range from C10 to C14 was fastest in compounds containing the C14 chains and slowest in the compounds containing C10 chains. LAS compounds having phenyl radicals near the terminal part of the alkyl chains could be decomposed easily. However, when the phenyl radicals were bound to the inner part of the chains it was more difficult to attack them. (Orr-FIRL)

Identifiers: *Water quality routing, Diffusion-convection equation, Galerkin method.

For the optimal management of waste discharge facilities, it is necessary to establish mathematical modeling of water quality routing of unsteady river flow. While flood routing and numerical analyses have been conducted, a large amount of error is introduced, particularly due to pseudo-dispersion caused by large space gradients of hydraulic quantities. In this case, the applicability of the Galerkin method is domonstrated. The method is based on finite element weighted residual methods and simulates a water quality problem using a diffusion-convection equation. Numerical errors are evaluated by means of an amplification factor as defined by Fourier analysis and are compared with those of several other finite difference methods. Computational efficiency of the Galerkin method is discussed, and application to a two-dimensional ideal model is considered. (Prague-FIRL)

Identifiers: *Cayuga Lake(NY), *Taughannock Creek(NY).

The effects of a cattle feedlot as a source of water pollution on Taughannock Creek, a Tributary of Cayuga Lake, were studied in terms of several common chemical parameters and in terms of most probable numbers of coliforms, fecal coliforms, fecal streptococci, denitrifiers, nitrifiers, and total plate counts. Data were highly variable, but the feedlot clearly contributed to pollution of the stream, although concentrations did not indicate severe pollution conditions. The feedlot contributed significant amounts of nitrogen and phosphate to the stream system and potentially to Cayuga Lake. Additional nitrogen probably originated from soils and groundwater in the drainage basin. Coliform, fecal coliform, and fecal streptococcus levels were conspicuously high at the feedlot. Although the concentrations of fecal coliforms and fecal streptococci quickly subsided and were low at the mouth of Taughannock Creek, the constant presence of Salmonella supported their utility as indicators of sanitary quality of surface waters. Many of the bacteria were transients, entering the water at the feedlot and disappearing downstream.

THE EFFECTS OF ARTIFICIAL DESTRATIFICATION ON THE WATER QUALITY AND MICROBIAL POPULATIONS OF HYRUM RESERVOIR,
Utah Center for Water Resources Research, Logan.
D. D. Drury, D. B. Porcella, and R. A. Gearheart.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 722, $7.00 in paper copy, $2.25 in microfiche. Utah Water Research Laboratory, Publication No. PRJEWO11-1, 174 p, 66 fig, 9 tab, 5 append. OWRT A-020-UTAH(1). 14-31-0001-4045.

Descriptors: *Destratification, Aeration, Algae, Bacteria, Thermocline, *Nutrients, Carbon, Phosphorus, Nitrogen, Oxygen, Temperature, Flow, Residence time, Lakes, *Utah, Trout, Dissolved oxygen, Eutorphication, Distribution, Water pollution effects, Water quality, Microbiology.
Identifiers: *Hyrum Reservoir(Utah), *Algal-bacterial dynamics, Little Bear River(Utah), *Aphanizomenon, Microbial populations.

Hyrum Reservoir, Utah, was studied for one year and then for a year following the initiation of artificial destratification. The redistribution of dissolved oxygen to the lower depths of the reservoir significantly increased the amount of habitat suitable for trout. The annual Aphanizomenon bloom increased during that first year after initiating destratification. The nitrogen cycle and the vertical distribution of bacteria were altered as a result of the elimination of the thermocline. During destratification the total suspended solids were correlated with the total coliforms. The water quality of Hyrum Reservoir was highly affected by annual runoff, spring and fall overturns, and destratification; sediments, the increased Aphanizomenon bloom, higher eiplimnetic nutrient concentrations, more uniform microbial and nutrient distributions all resulted from these hydraulic factors working singly and in combination.

PHTHALATE ESTERS, HEARTRATE DEPRESSORS IN THE GOLDFISH,
Oak Ridge National Lab., Tenn.
P. Pfuderer, and A. A. Francis.
Bulletin of Environmental Contamination and Toxicology, Vol 13, No 3, p 275-279, March 1975. 2 tab, 13 ref.

Descriptors: Wastes, *Fish physiology, *Bioassay, *Inhibitors, Mode of action, Path of pollutants, Food chains, Reproduction, Growth rates, Public health, Water pollution effects.
Identifiers: *Phthalate esters, *Dibutyl phthalate, *Heartrate depressors, *Goldfish.

Phthalate esters, an additive in polyvinyl chloride manufacture, were isolated as heartrate depressors in goldfish. Three compounds were identified and the most active was dibutyl phthalate, probably because it was the most water soluble of the three. Heartrates returned to resting levels when the fish were put through two or more changes of fresh water. The phthalate esters probably affect the heartrate indirectly through the nervous systems. Identifiers: *Asulam, Partriges, Carassius auratus, Lepomis macrochirus, Pheasants.

The results of the acute toxicity experiments conducted to determine the hazard of asulam, a herbicide, to wildlife species are presented. Results of acute toxicity experiments indicate a low order of toxicity resulting from massive doses of asulam given by gavage, in the diet or in bath waters to rainbow trout, channel catfish, bluegill, mallard duck, pheasants and other test organisms, concluded that asulam presents a very low tial for hazard to wildlife in treated areas. THE EFFECT OF METHYL MERCUR GILL METABOLISM AND BLOOD PAR TERS OF RAINBOW TROUT,
Michigan State Univ., East Lansing.
D. V. O'Conner, and P. O. Fromm.
Bulletin of Environmental Contaminatio Toxicology, Vol 13, No 4, p 406-411, April, tab, 15 ref.

Descriptors: *Mercury, *Bioassay, physiology, *Metabolism, *Electro *Oxygen, *Rainbow trout, Water pollutio fects, Laboratory tests, Metals.
Identifiers: Gills, Sublethal effects, Plasma.

Methyl mercury has been shown to accumul gill tissue up to several thousand times the found in the media. The effects of methyl m on the metabolism or physiological fu (plasma electrolyte regulation) of the gill we vestigated. Rainbow trout were used in the say and results indicate that up to 12 weeks sure to methyl mercuric chloride (10 m Hg/liter) does not affect the in vitro metaboli the gill or concentration of plasma electroly rainbow trout. The only deleterious effec hibited by fish was a significant increase matocrit after 12-weeks exposure. There is a to consider the effects of long-term exposu methyl mercury. (Katz)

ment analysis of profundal surface sediments
Minnesota lakes has demonstrated that sedi-
mentary organic matter derives mainly from detritus produced within the lakes. Only in the most oligotrophic and unproductive lakes are terrestriail inputs to sedimentary organic matter likely to be considerable. Rising concentrations of fossil pigments in sedimentary organic matter, which are easily and quickly measured, offer a clear stratigraphic indication of the onset of cultural eutrophication. The time of onset can then be determined by other techniques such as pollen analysis, radio-isotope dating, etc. A record has been obtained of the degree of leaching and of erosion in postglacial times at Kirchner Marsh, the site of intensive paleoecological studies by several investigators. Periods of low erosion are indicated by low concentrations of Na, K, and Mg in the lake sedimentsand correlate generally with periods of high lake productivity. Carbonates disappeared from the sediments about 5,000 year ago. Stratigraphic analyses of short cores of lake sediments show a distinct change in diatom flora, which can be correlated with known historic disturbances in the watershed or the lake, such as waste disposal, agricultural land clearance, and logging. When the nature and the magnitude of the changes can be identified by this technique, it will be possible to plan lake-restoration projects. (Waelti-Minnesota)

**BIOCHEMICAL AND NUTRITIONAL INTERACTIONS BETWEEN THE OYSTER (CRASSOSTERA VIRGINICA (GMELIN) AND ITS ENVIRONMENT,**
Maryland Univ., College Park. Dept. of Chemistry.
M. Keeney.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 775, $3.25 in paper copy, $2.25 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No 32, June 1975, 5 p. OWRT B-018-MD(1) 14-31-0001-4090.

Descriptors: *Oyster, *Enzymes, *Metabolism, *Heavy metals, *Cadmium, Nutrients, Biochemistry, *Adsorption, *Estuarine environment, Toxicity, *Lethal limit, Water pollution effects, Jelly fish, Phosphates.
Identifiers: Phosphoenolpyruvate carboxykinase, Diphosphoinositides, Phosphatases.

The purpose was to obtain information on the biochemical and nutritional interactions between estuarine organisms and their environment in order to understand the effects of heavy metal uptake on these animals. A Ph.D. thesis on enzyme activity of phosphoenolpyruvate carboxykinase in the cytoplasm of the oyster has been completed. This enzyme may be involved in glycogen synthesis in the oyster. A M.S. thesis on diphosphoinositides in oyster lipid has also been completed. A study of acute toxicity levels of cadmium in water has indicated that the toxic level is between 0.1 and 0.25 ppm for oysters as measured by shell growth under laboratory conditions. A paper on phosphatases in the jellyfish has been published. Both acid phosphatases and alkaline phosphatases show similarities to veotebrate enzymes.

**EFFECTS OF ORIGINAL VEGETATION ON RESERVOIR WATER QUALITY,**
Texas A and M Univ., College Station. Water Resources Inst.
J. Ball, C. Weldon, and B. Crocker.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 777, $5.75 in paper copy, $2.25 in microfiche. Technical Report No TR-64, April, 1975. 120 p, 54 fig, 16 tab, 2 append, 18 ref. OWRT A-025-TEX(1), 14-31-0001-3844, 14-31-0001-4044, 14-31-0001-5044.

Descriptors: *Nutrients, *Vegetation, *Leaching, Grasses, Trees, Reservoirs, Water quality, *Texas, *Nitrogen, *Phosphorus, *Land clearing, *Pre-impoundment, Reservoir sites, Water pollution effects.
Identifiers: *Reservoir water quality, Reservoir clearing policy, Palmetto Bend Project(Tex), Herbage.

Leaching studies were conducted on representative grasses, herbage and trees to determine the relative nutrient release rates of nitrogen and phosphorous. In addition, a limited field study was conducted as well as a vegetation inventory at a proposed Bureau of Reclamation reservoir, site near Edna, Texas. The results of the leaching study were presented as percent nutrients released from the various types of vegetation as a function of time. The total quantity and rate of nutrient release varied greatly depending upon the type of vegetation. An an example, grasses and herbage (1) release nutrients at a greater rate, (2) contain a greater quantity of nutrients per unit weight of vegetation and generally are more available in greater quantities based on weight per unit area than trees. This indicated that although trees are often the only vegetation removed from a reservoir site, the amount of nutrients available for release by the herbage and grasses will probably have a much more significant impact on reservoir water quality and should be considered in the reservoir clearing policy. Several recommendations were made including a methodology for predicting the effects of original vegetation on reservoir water quality for any specific project.

**TEMPERATURE EFFECTS ON EGGS AND FRY OF PERCOID FISHES,**
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
L. L. Smith, Jr., and W. M. Koenst.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-242 746, $5.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/3-75-017, May 1975. 91 p, 9 fig, 16 tab, 33 ref, 2 append. EPA 1BA021, R-800704.

Descriptors: *Sauger, *Walleye, *Environmental effects, *Growth rates, *Fish eggs, *Fish larvae, Juvenile fishes, Growth stages, Water pollution effects, Cold resistance, Heat resistance, Water pollution effects, Thermal pollution, Lethal limit.
Identifiers: Temperature tolerance, Acclimation, Percoid fishes.

Temperature effects on the early life history stages of the walleye (Stizostedion vitreum vitreum (Mitchill) and sauger (Stizostedion canadense (Smith)) were examined. Walleye eggs and fry were exposed to six temperatures (6-21C) for effects on fertilization, incubation, and fry survival. Mature sauger were held and eggs were fertilized at four temperatures (9-18C). Both species were incubated at 6-21C. Sauger fry survival was also tested at 6-21C. Optimum fertilization temperatures were 6-12C for walleye and 9-15C for sauger. Optimum incubation temperatures were 12-15C for both walleye and sauger. A sharp drop or rise in temperature had no great effect on walleye fry and juvenile survival except when the upper lethal or lower lethal temperature was approached. Optimum temperature for juvenile walleye and sauger growth was 22C. Upper lethal temperatures for walleye juveniles were determined for acclimation temperatures at 2C intervals between 8-26C. The upper lethal temperature for walleye juveniles was 27.0-31.6C, depending on acclimation. The upper lethal temperature of sauger acclimated to 10-26C was 26.6-30.4C. There was little temperature difference (1-2C) between 100% survival and no survival. (EPA)

**TOXICITY OF SELECTED PESTICIDES TO THE BAY MUSSEL (MYTILUS EDULIS),**
Stanford Research Inst., Menlo Park, Calif.
D. H. W. Liu, and J. M. Lee.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 221, $5.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/3-75-016, May 1975. 102 p, 8 fig, 30 tab, 36 ref, 3 append. EPA Program Element 1BA022, 68-01-0190.

Descriptors: Water pollution effects, *Pesticide toxicity, *Mussels, Mollusks, Marine animals, *Insecticides, *Herbicides, 2,4-D, Growth stages, *Embryonic growth stage, *Larval growth stage.
Identifiers: Sevin, Treflan, Methoxychlor, Malathion.

The toxicity of the insecticides Sevin, methoxychlor, and malathion and of the herbicides Treflan and 2,4-D to the bay mussel (Mytilus edulis) was investigated. Toxic effects were measured in terms of survival of and byssus-thread attachment by adults, embryoshell development, and larval growth and metamorphosis. Growth was the most sensitive measure of toxicity. All the pesticides produced statistically significant ($p = 0.05$) reductions in larval shell length after 10 to 20 days of exposure. Relative to potency, methoxychlor was the most toxic, and 2,4-D was the least toxic. The 96-hour TL50 values for each pesticide, based on adult survival and attachment data, were estimated, as were the 48-hour EC50 values based on data from embryo bioassays. The effects on embryo development of delaying the time of fertilization and of using seawater larval culture media of various ages also were studied, and substrate preference by metamorphosing larvae was investigated. A critical evaluation of the experimental approach and procedures is presented. (EPA)

**THE RESPONSE OF GYMNODINIUM BREVE TO MUNICIPAL WASTE MATERIALS,**
University of South Florida, Tampa. Dept. of Chemistry.
M. T. Doig, III, and D. F. Martin.
Mar Biol (Berl). Vol 24, No 3, p 223-228, 1974, Illus.

Descriptors: *Eutrophication, Nutrients, Effluents, *Sewage effluents, *Water pollution sources, Biocontrol, Wastes, *Fish diseases, *Municipal wastes, Microorganisms, *Dinoflagellates, *Gymnodynium, *Florida, Fishkills.
Identifiers: *Gymnodinium-breve, Orthophosphate.

The response of the unarmored dinoflagellate G. breve, which is the causative organism in catastrophic fish kills along the Florida Gulf Coast, to enrichment with selected inorganic nutrients, municipal waste materials and various detergent components has been determined. The biostimulatory effects of the various enrichments were determined by a modification of the Provisional Algal Assay Procedure of the Joint Industry/Government Task Force on Eutrophication. Inorganic nutrients (orthophosphate, nitrate and ammonia) were added individually and in combination, and the results were compared to equivalent enrichments with the effluent from a secondary sewage-treatment plant. The maximum cell population, N sub max, attained could be increased 3-fold by the sewage-treatment plant effluent or by the equivalent combination of inorganic nutrients; individually, however, the inorganic nutrients had no pronounced effect on maximum cell population, N sub max (except for a 30% increase produced by slight orthophosphate enrichment). The results of these studies indicate that, at concentrations of orthophosphate typical of Florida coastal waters (about 0.10 ppm), the growth-promoting potential (as reflected by N sub max) of the medium was a linear function of the ammonia-nitrogen concentration (0.01 to 0.11 ppm). The sewage-treatment plant effluent was presumably low in detergent phosphate, having been obtained from a treatment plant some 6 mo. after the enactment of a ban on phosphate-containing detergents. Additions of orthophosphate or detergent-phosphate to the treatment-plant effluent did not significantly increase the observed biostimulatory effect of the waste material.--Copyright 1974, Biological Abstracts, Inc.

**CRITICAL LEVELS OF PHOSPHORUS AND NITROGEN IN TEXAS IMPOUNDMENTS,**
Texas Univ., Dallas. Inst. for Environmental Studies.
G. F. Lee.
IES Occasional Publication No 2 (undated). 7 p.

Descriptors: *Standards, *Nutrients, *Eutrophication, *Arid climates, *Texas, Phosphorus, Nitrogen, Impoundments, Federal Water Pollution Control Act, Water pollution control, Management, Water quality, Subtropic.
Identifiers: *Critical nutrient levels, Warm-water lakes.

The approach necessary to establish critical nutrient loading criteria for Texas' impounded waters is discussed. Texas impoundments have a wide variety of water quality although are they rarely classified as oligotrophic. The question is: what is the aquatic plant nutrient load that causes significant water quality deterioration in warm-water lakes. In addition to affecting how the public perceives algal growth in Texas impoundments, turbidity due to erosional materials could have a pronounced effect on how a certain nutrient load affects algal growth. After review of available information on aquatic plant-nutrient response in lakes and impoundments throughtout the U.S., it is concluded there is insufficient information today to establish critical nutrient concentrations or loads for Texas impoundments. Because of the importance of criteria in developing water quality management plans, it is recommended no attempt be made to develop criteria at this time as these standards must be based on situations specifically applicable to Texas. Consideration must be given to the public's response to water quality, recreational and other uses as a function of algal and other aquatic plant growth, and the limnological and environmental chemical aspects of nutrient transport and cycling. (Jones-Wisconsin)

**PRELIMINARY RESULTS OF A STUDY CONCERNING THE EFFECTS OF THERMAL POLLUTION ON PHYTOPLANKTONIC PRIMARY PRODUCTION IN LAKE WABAMUN, ALBERTA,**
Alberta Univ., Edmonton. Dept. of Zoology.
L. Noton.
In: Proceedings, Symposium on the Lakes Western Canada, 1973, Water Resources Cen University of Alberta, Edmonton, p 304-312, 1 1 tab.

Descriptors: *Thermal pollution, *Phytoplankt *Primary productivity, Canada, Electric pow plants, Surface waters.
Identifiers: *Lake Wabamun(Alberta).

Production of phytoplankton was monitored thirteen months to determine productivity ra for Lake Wabamun, Alberta, as a whole and fects on these rates of warm water effluent fr two electric generating stations. Phytoplank were enumerated, chlorophyll-a determined, chemical analysis of the water made. Product rates at the surface of the warm water effluen Wabamun plant were significantly greater t surface rates at other stations. However, prod tivity at 0.5 m and 1.0 m was unaffected. Simila the surface rates for the Wabamun plant area general were higher than those of the open lake rates were not higher at depths of 0.5 m and 1.0 Winter production in the open area was greate the Wabamun station that at the central area at surface only. The Sundance power area in gene showed greater production at the surface than the open area during summer 1972. There were differences at the 0.5 m and 1.0 m depths. C Sundance station had lower rates than any of other Sundance stations when power plant was operating. Resumption of plant operations co cided with an increase in productivity at this tion to the level of the other Sundance statio (Jones-Wisconsin)

**CHANGES IN THE SUBMERG MACROPHYTE COMMUNITIES OF LA WABAMUM AS A RESULT OF THERM DISCHARGES,**
Alberta Univ., Edmonton. Dept. of Botany.
E. D. Allen, and P. R. Gorham.
In: Proceedings Symposium on the Lakes Western Canada, June 1973, Water Resour Centre, University of Alberta, Edmonton, p 3 324, 8 fig, 5 ref.

Descriptors: *Sumberged plants, *Aquatic wee *Thermal pollution, Canada, Chara, Powerplan Water temperature, Succession, Adaptation.
Identifiers: *Lake Wabamun(Alberta), Elod candensis, Myriophyllum, Potamogeton pe tinatus.

To define factors responsible for the large amou of submerged macrophytes in Lake Wabamun, survey of species was made. Elodea canaden had not been previously listed, is rare in Alber but was the dominant species present. It h replaced Myriophyllum and Chara between 196 1968. After the Sundance Power Plant beg operations in 1970, Elodea and Myriophyllu gradually decreased and Potamogeton pectinat increased in the discharge canal. In the dischar canal mouth, Myriophyllum died out in a year. September much of the Chara died, possibly d to reduced light and photosynthesis coupled wi isothermal heating and increased respiration; th is respiratory loss exceeded photosynthetic ga for a few days, opening a habitat for Elodea inv sion, which was followed by consolidation and e tensive spread in the direction of the prevaili pattern of the plume. Presumably a similar situ tion had occurred near the Wabamun power pla in 1967. In Kapasiwin Bay, fluctuations in wee growth were better correlated with water lev variations and hours of sunshine than with therm effluent from the Wabamun plant. Weed problem in Lake Wabamun appear to be a consequence the operation of two power plants rather tha production of increased quantities; the specie change aggravated the situation. (Buchana Davidson-Wisconsin)

ntifiers: Lake Okanagan(British Columbia),
e Skaha(British Columbia), Lake
yoos(British Columbia), Lake Wood(British
umbia), Lake Kalamlka(British Columbia).

rophication was studied in 1969-71 in five lakes
the Okanagan Valley. Four basins were
ntified in Lake Okanagan. The total dissolved
ds, calcium, and electrical conductivity
reased from north to south. Macroelements in
s Okanagan, Skaha, and Osoyoos were not
stantially different, but Lakes Kalamalka and
od were twice higher in sodium, potassium,
magnesium and about 1.5 times in total dis-
ed solids. Four copepods and nine cladocerans
e found; four species, Cyclops bicuspidatus
nasi, Diaptomus ashlandi, Diaphanosoma
chtenbergianum, and Daphnia longiremis were
inant in all the lakes and Daphnia thorata was
mon in four lakes. The upper 50 m contained
of the total plankters in Lake Okanagan, and
e was little horizontal variation. Crustaceans
e less abundant in inshore waters. Settled net
kton volume varied. Compared to 1935 data,
e was little change in the zooplankton species,
hi disc visibility, and dissolved oxygen in the
olmnion, but net plankton values were greater.
es Okanagan and Kalamalka were oligotrophic
close to mesotrophic; Lake Wood moderately
ophic, and Lakes Skaha and Osoyoos mar-
y eutrophic. Changes during the past century
predictions for 1990 about the phosphorus
s are made. (Buchanan-Davidson--Wisconsin)

national concern has stimulated considerable
rch on the nature and causes of the lake aging
ss, including the development of various
ol techniques. There is presently great need
compilation of information which thoroughly
ments the broad spectrum of lake restoration-
ted activities. Studies that are essential ad-
s to any nutrient limitation program include
says, nutrient budgets, hydraulic and
horus residence times, and nutrient
nge reactions. Present lake rehabilitation
ilities are substantial, although in need of ex-
e, well-documented testing, and future prospects for success in this realm of environmental management are very encouraging. This state-of-the-art review represents an attempt to delineate the accomplishments of lake restoration-related activities worldwide. Information was acquired through an extensive mail survey (about 8000 entries), cooperation of several international journals/newsletters, and a systematic literature search including foreign as well as domestic materials. The contents of this report consist of five major divisions: identification, description and present utility of the various techniques; compilation and description of individual past and/or ongoing restoration experiences (almost 600 accounts); project methodology; name and address of people providing pertinent information (over 300 respondents); and literature references (more than 800 documents). **FAUNA AND FLORA IN HYDRAULIC CLAM DREDGE COLLECTIONS FROM FLORIDA WEST AND SOUTHEAST COASTS,**
Florida Dept. of Natural Resources, St. Petersburg. Marine Research Lab.
M. F. Godcharles, and W. C. Jaap.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-74 10276, $4.75 in paper copy, $2.25 in microfiche. Special Scientific Report No 40, December 1973. 89 p, 17 fig, 2 tab, 9 ref.

Descriptors: *Marine algae, *Marine animals, *Marine plants, *Varieties, *Florida, Coasts, Mollusks, Crustaceans, Habitats, Fish, Annelids, Clams, Ecological distribution, Sampling, Gulf of Mexico.
Identifiers: Echinoderms, Cnidarians, Atlantic coast, Dredge sampling.

Two exploratory programs to locate commercial clam populations off west and southeast Florida were carried on. An an adjunct to these endeavors was the analysis of associated fauna and flora collected by two gear types: a hydraulic Nantucket dredge operated from the R/V Hernan Cortez and a Maryland escalator soft-shell clam dredge, operated from the R/V Venus. The chief distinctions between these two gear types were that the Venus operated in shallower depths (0.9 to 4.6 m) and that its conveyor belt system provided continuous harvesting and was more selective for smaller clams because of smaller mesh size. In contrast, operating depth of the Nantucket dredge was 3.1 to 14.6 m. Florida east coast and shallow estuarine west coast areas were explored with the R/V Venus. A total of 453 taxa, primarily mollusks (64 gastropods, 95 bivalves,) crustaceans (111), fish (57), echinoderms (36), annelids (32), and cnidarians (30) were identified. Depth, water temperature, salinity, substrate type, and water clarity were recorded at each station. An effort was made to collect, identify and count all live specimens and these are listed by locality, depth, and numbers collected. (Jones-Wisconsin)

Descriptors: *Pesticides, *Polychlorinated biphenols, *Heavy metals, *Food chains, Florida, Insecticides, DDT, DDE, DDD, Dieldrin, Arsenic compounds, Mercury, Cadmium, Lead, Zinc, Copper, Aquatic animals, Chlorinated hydrocarbon pesticides, Baseline studies, Birds, Fish, Shellfish, Frogs, Toxicity, Pesticide residues.
Identifiers: *Everglades National Park(Fla), Alligators, Crocodiles, Eggs.

This investigation was designed to compile baseline information on the distribution of pollutants which are known to, or strongly suspected of, adversely affecting upper trophic level vertebrates and invertebrates present in south Florida environments. Ninety-five samples, including brain and breast tissue and eggs of various birds, alligator and crocodile eggs, fish and shellfish, and frogs were analyzed for residues of chlorinated insecticides (DDT, DDE, DDD, and Dieldrin), and for the persistent chlorinated industrial compounds polychlorinated biphenols. Each sample was also tested for residues of arsenic, mercury, cadmium, lead, zinc and copper. The resulting analyses provide a baseline for future analyses, and clues for particular poisons or particular species in need of more intensive study. These data revealed that DDT, DDE, DDD, Dieldrin, and PCBs appear to exist in concentrations well below amounts known to have either acute or chronic effects on local species. Less is known of the significance of the various metal concentrations reported here, although levels of mercury in freshwater vertebrates, and arsenic in marine species are great enough to deserve more intensive study. **RECOVERY OF POLLUTED LAKES. A SWEDISH RESEARCH PROGRAM ON THE EFFECTS OF ADVANCED WASTE WATER TREATMENT AND SEWAGE DIVERSION,**
Uppsala Univ. (Sweden). Algal Assay Lab.
C. Forsberg, S-O. Ryding, and A. Claesson.
Water Research, Vol 9, No 1, p 51-59, 1975. 4 fig, 7 tab, 31 ref.

Descriptors: *Water pollution control, *Lakes, *Waste water treatment, *Sewage, *Diversion, Phosphorus, Eutrophication, Monitoring, Nutrients, Limiting factors, Chlorophyll, Suspended solids, Nitrogen, Bioassay, Europe, Investigations, Nutrient removal.
Identifiers: Lake restoration.

The National Swedish Environment Protection Board began a program in 1972 to analyze the effects of phosphorus removal at advanced wastewater treatment plants on 18 lakes and 15 treatment plants. The effects of diversion of sewage effluents from some lakes are also being investigated. Sewage treatment plant efficiency is continuously monitored by the new Minitest method and the nutrient loads from these plants as well as from other sources are calculated. Water quality is illustrated by the correlation between chlorophyll-a and suspended solids; the correlation coefficient was +0.88. The first sign of lake recovery was observed after an 85% reduction of the waste phosphorus load. Post-precipitation (Al-sulphate) decreased the yearly load from 2000 kg P to 300 kg, which gave a 50% reduction to the recipient water. Chlorophyll values also decreased. The role of nitrogen and phosphorus as algal growth limiting nutrients was studied by algal assay. Nitrogen limited Selenastrum capricornutum growth in two-thirds of the samples. In filtered lake water phosphorus was the growth limiting nutrient at total-P values below 0.05 mg/l. Above 0.1 mg P/1 nitrogen played the principal role. Between these values algal growth was primarily limited by P or N or chelating agents. (Jones-Wisconsin)

**NITRATE IN WATER, SOIL, PLANTS AND ANIMALS,**
Sunning House, Sunningdale (England).
A. H. Walters.
International Journal of Environmental Studies, Vol 5, No 2, p 105-115, 1973. 4 tab, 46 ref.

Descriptors: *Hazards, *Nitrates, *Water pollution, *Path of pollutants, *Soil contamination, Public health, Fertilizers, Nitrites, Potable water, Crops, Animal pathology, Nitrification.

World aspects of nitrate pollution in water and soils mainly due to excess application of artificial fertilizers are discussed. During the last 20 years it has been scientifically established in many countries that crops, including grass, do not contain excess amounts of nitrate provided they have been grown in naturally manured soils, or in soils which have received moderate and correctly controlled treatments with artificial fertilizers applied within suitable farming systems. It has also been clearly established that the widespread abuse of the use of artificial fertilizers can definitely introduce a health hazard in farm animals due to the uptake of nitrate into the fodder crops, as well as eutrophication and soil structure and fertility breakdown problems. The introduction of nitrate into foodstuffs and water can constitute a human health hazard. The connection between intake of nitrate and methaemoglobinaemia in Man and animals has been amply demonstrated, and work is now proceeding to establish a possible connection between nitrosamines and conditions such as cancer and spina bifida. To minimize such hazards it is suggested that much more effective standards on the use of artificial fertilizers is needed. (Jones-Wisconsin)

**IDENTITY AND REGULATION OF NUTRIENTS LIMITING PHYTOPLANKTON IN THE SHALLOW ESTUARIES NEAR BEAUFORT, N.C.,**
National Marine Fisheries Service, Beaufort, N.C. Atlantic Estuarine Fisheries Center.
G. W. Thayer.
Oceologia (Berl), Vol 14, p 75-92, 1974. 7 fig, 4 tab, 37 ref.

Descriptors: *Nutrients, *Phytoplankton, *Productivity, *Limiting factors, *Estuaries, North Carolina, Nitrogen, Phosphorus, Photosynthesis, Bacteria, Decomposing organic matter, Carbon, Detritus.
Identifiers: *Beaufort(NC).

Enrichment experiments to test the hypothesis that nitrogen was the prime limiting nutrient and experiments to determine whether microbial competition for nitrogen and phosphorus might limit the availability of these nutrients to the phytoplankton are described. Inorganic nutrients limiting phytoplankton production in the shallow estuarine system near Beaufort, North Carolina were identified. Nitrogen was the primary limiting nutrient and was phosphorus limiting at times. Samples receiving a complete enrichment medium plus organic substrates poor or lacking in nitrogen and phosphorus showed no significant increase in relative photosynthesis over unenriched controls, even though there was a significant decrease in the nitrogen and phosphorus concentrations in the enriched samples. This suggested that microbial immobilization of nitrogen and phosphorus during decomposition of organic matter may limit nutrient availability to phytoplankton and in part account for the general paucity of inorganic nutrients present in this shallow system. The estimated amounts of carbon, nitrogen and phosphorus entering the estuarine system in the form of partially decayed Spartina alterniflora each year are given. Data suggested that an annual cycle in nutrient concentration in the estuarine system in part may result from shifts in the equilibrium between microbial immobilization and remineralization. (Jones-Wisconsin)

**WATER POLLUTION FROM NONPOINT SOURCES,**
Midwest Research Inst., Kansas City, Mo.
A. D. McElroy, S. Y. Chiu, J. W. Nebgen, A. Aleti, and A. E. Vandergrift
Water Research, Vol 9, No 7, p 675-681, 1975. 3 tab, 18 ref.

Descriptors: *Water pollution sources, *Pollutants, Erosion, Agriculture, Forest management, Mining, Construction, Nutrients, Pesticides, Organic wastes, Thermal pollution, Acid mine water, Grasslands, Sedimentation rates, Saline water, Radioactive wastes, Heavy metals, Farm wastes, Pathogenic bacteria.
Identifiers: *Nonpoint pollution sources.

The nature and extent of nonpoint pollution sources in the United States were assessed for four major industrial activities: agriculture, silviculture, mining, and construction. Nonpoint pollutants exert a significant influence on water quality in the United States. Based on land use data, more than 97% of the land area in the U.S. is a potential source of nonpoint pollution. Among the pollutants identified from agriculture, silverculture, mining, and construction, important pollutants are sediment, nutrients, pesticides, organic wastes, thermal discharges, acid mine drainage, salinity, radioactivity, microbial pollutants, and heavy metals. Agriculture, especially cropland, is responsible for the release of large quanties of sediment, nutrients, and pesticides. Because of the production of large quantities of organic wastes from livestock operations, these wastes can be potential sources of water quality degradation, if not handled properly. Silviculture is a source of sediment. Other pollutants originating from silvercultural operations include very limited quantities of nutrients, pesticides, and thermal discharges. Surface mining is a major source of erosion sediment. Acid mine drainage, salinity, and heavy metals are other important pollutants from mining. Sediment is a major pollutant from construction industry. (Jones-Wisconsin)

**COPPER (II)--NITRILOTRIACETATE COMPLEXES IN AQUEOUS SOLUTION,**
Waterloo Univ., Ontario. Dept. of Chemistry.
W. A. E. McBryde, and L. J. McCourt.
Journal Inorganic Nuclear Chemistry, Vol 33, No 12, p 4193-4197, 1973. 1 fig, 4 tab, 4 ref.

Descriptors: *Copper, *Copper compounds, *Nitrilotriacetic acid, *Chelation, Aqueous solutions, Hydrogen ion concentration, Measurement, Equations, Stability, Potassium compounds.
Identifiers: *Complexes, NTA.

Previous studies disagreed on the composition and stability of the complex formed by copper (II) and nitrilotriacetic acid. On repeating the experiments, copper was mainly present in the form of complexes in solutions containing an excess of nitrilotriacetic acid, even when the pH was less than 2. Under these circumstances, it is questionable whether pH titration measurements are capable of defining the equilibrium constant. The method of hydrogen ion balance previously used was shown to be unsuitable. The composition of stability constants of copper (II) complexes with nitrilotriacetic acid were studied in aqueous 0.1 molar potassium nitrate solution at 25C by means of a solid-state copper-ion sensitive electrode. Experimental data could be fitted to equations by assuming that a single species (ML) was formed, but could be better fitted with two formation constants applying to two species, ML and MHL (M equals copper, H3L equals nitrilotriacetic acid). MHL species appeared only at very low hydrogen ion concentrations. The average pK-alpha for the reaction was 1.25. The results indicated that the simple 1:1 complex was the predominant species, but at low pH it became protonated. Log beta ML was 13.21 and log beta MHL was 14.46-14.87, depending on the pK1 value used for nitrilotriacetic acid. (Buchanan-Davidson--Wisconsin)

**A MODEL OF INORGANIC CARBON LIMITA TION IN NATURAL WATERS,**
Texas Univ., Dallas. Inst. for Environmental Studies.
D. W. James, and G. F. Lee.
Water, Air, and Soil Pollution, Vol 3, p 315-320, 1974. 1 fig, 1 tab, 7 ref. EPA 16010-EHR, TG 5P2 WP-184-04.

Descriptors: *Mathematical models, *Inorganic compounds, *Carbon, *Limiting factors, Carbon dioxide, Eutrophication, Algae, Hydrogen ion concentration, Alkalinity.

To understand the role of inorganic carbon in eutrophication, a mathematical model was constructed to determine if inorganic carbon limits planktonic algae productivity in a body of water. The model depends on the ability to account for changes in inorganic carbon species concentrations, especially aqueous carbon dioxide. The basis of the model is the application of the chain rule for partial derivatives, with the rate of pH change calculated as the product of the rate of carbon dioxide change and change in pH as carbon dioxide changes. Given data on gross productivity, algal-bacterial respiration rates, carbon dioxide gas transfer rates, temperature, alkalinity, initial pH, and epilimnion depth, the model calculates the theoretical magnitude of change of pH with change of temperature in the water body during the photosynthetic period. Based on sample calculations under various chemical, physical, and biological conditions, a change in pH to change of temperature ratio greater than 2.0 units was necessary for inorganic carbon limitation to occur. Results suggest that carbon limitation of total planktonic algal growth would be rare in most natural waters, but could occur in low alkalinity water which would influence the species of algae present. **MICROBIAL DEGRADATION OF DDT,**
Cornell Univ., Ithaca, N.Y.
M. Alexander.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-781 903, $3.75 in paper copy, $2.25 in microfiche. ONR Report June 1974. 34 p, 9 fig, 7 tab, 29 ref. NR 306-067. N00014-67-A-0077-0027.

Descriptors: *Pesticides, *Microbial degradation, *Pesticide removal, *DDT, *Marine bacteria, Chlorine, Oceans, Fungi, Mode of action, Aromatic compounds.
Identifiers: Mucor alternans, Dechlorination.

Investigations with marine bacteria to determine their ability to convert DDT to water-soluble products are described. Mucor alternans converted DDT to water-soluble metabolites at a rate four times greater than the most active marine bacterium. Techniques were developed to isolate and purify these metabolites. These compounds are different from the previously described DDT metabolites, and they do not contain chlorine. If the absence of chlorine is confirmed, these compounds represent products of the most extensive microbial degradation of DDT yet reported. To model marine communities were added eighty different carbon sources in a total of 100 separate treatments, but in no case were water-soluble products of DDT metabolism detected. Microorganisms were found to be capable of converting diphenylmethane, an analog of DDT to 1,1,1',1'-tetraphenyldimethyl ether. Para-substituted aromatic compounds were toxic to some bacteria, even at low levels, but a few stimulated growth of individual bacteria. The relationship of chemical structure to biodegradability of DDT analogs was investigated. Para substitution of one of the two aromatic rings with chloro, nitro, hydroxyl, or amino groups significantly reduced the rate of biodegradability. The most resistant compounds were those with both rings containing these substituents. (Jones-Wisconsin)

**AN ECOSYSTEM MODEL FOR THE PELAGIC ZONE OF LAKE WINGRA,**
Wisconsin Univ., Madison.
A. J. A. MacCormick, O. L. Loucks, J. F. Koonce, J. F. Kitchell, and P. R. Weiler.
International Biological Program, EDFB-IBP 74-7 (Biology and Medicine UC-48), October 1974. 100 p, 9 fig, 23 tab, 12 ref. NSF AG-199, 40-193-69, AEC W-7405-eng-26.

Descriptors: *Lakes, *Model studies, Wisconsin, Biomass, Phytoplankton, Zooplankton, Benthos, Fish, Detritus, Sediments, Organic matter, Phosphorus, Ecosystems, Productivity, Computer programs.
Identifiers: *Pelagic zone, *Lake Wingra(Wis).

The status of an open-lake model for the pelagic zone of Lake Wingra, Wisconsin designed to simulate the transfer of biomass at a relatively aggregated level of resolution, is described. Although the resolution is intended to be gross, and the output cannot be expected to show the sharp variation of individual process sub-models, the pelagic zone model leans heavily on the lessons from the process sub-models. It is intended to address questions concerning general response characteristics rather than questions of detail. It is an attempt to represent a projection of the real ecosystem into the subspace defined by the variables. These variables are incorporated in the model, and a 'true' model would be an exact mathematical representation of the projection. However, the projection cannot be known. It was the intention to base the model on understanding gained from the detailed process studies of the different components, e.g., phytoplankton, zooplankton, benthos, etc. Because different process studies are at different stages of development, all the mathematical detail of the process models are not included in the general model. It is felt that the model works well and the results and insight it provides are good. (Jones-Wisconsin)

**THE STRUCTURE AND PRODUCTION OF PHYTOPLANKTON IN MIKOLAJSKIE LAKE,**
Polish Academy of Sciences, Warsaw. Dept. of Hydrobiology.
I. Spodniewska.
Ekologia Polska, Vol 22, No 1, p 65-106, 1974. 10 fig, 14 tab, 74 ref.

Descriptors: *Biomass, *Productivity, *Phytoplankton, Eutrophication, Diatoms, Dinoflagellates, Biological communities, Trophic level, Nannoplankton, Deep-water habitats, Varieties, Algae, Distribution, Decomposing organic matter, Period of growth, Seasonal, Europe.
Identifiers: *Mikolajskie Lake(Poland), Holomictic lake.

In order to determine the direction and rates of changes in the trophic level of lakes, preliminary studies were conducted in the pelagic zone of Mikolajskie Lake in the Masurian Lakeland of Poland (eutrophic, holomictic, maximum depth 27.8 m). The seasonal variability of composition, biomass and production of phytoplankton in different years of the studies (1963-1970) was analyzed. In the phytoplankton development, two maxima were observed: that in spring--having relatively small biomass of algae (averaging about 6 mg/l) and distinct domination of diatoms in the plankton, and that in summer--with a much higher algal biomass (10-30 mg/l) and dominated by dinoflagellates. The mean phytoplankton production in spring and summer remained on a constant level (about 1.0 mg oxygen per day) despite the directional changes in the phytoplankton structure and distinct increase of algal biomass in summer during the last years of the studies. Simultaneously an increase of maximal values of phytoplankton production and an increase of decomposition of organic matter has been observed. Both the species composition and seasonal dynamics of phytoplankton development and the values of biomass and production of planktonic algae in this lake are typical for naturally eutrophic lakes, of average fertility and with a distinct periodicity of phytoplankton development. (Jones-Wisconsin)

**EXPERIMENTALLY INCREASED FISH STOCK IN THE POND TYPE LAKE WARNIAK. I. PHYSICAL AND CHEMICAL CONDITIONS IN LAKE WATER,**
Instytut Rybactwa Srodladowego, Gizycko (Poland). Lake Field Station.
J. Zachwieja.
Ekologia Polska, Vol XXI, No 27, p 405-421, 1973. 6 fig, 2 tab, 38 ref.

Descriptors: *Fish stocking, *Physical properties, *Chemical properties, *Lakes, Ice cover, Temperature, Stratification, Oxygen, Winterkilling, Aquatic plants, Secchi disks, Conductivity.
Identifiers: *Lake Warniak(Poland).

Physical and chemical studies of Lake Warniak, Poland have been carried out in connection with studies of the effect of newly introduced fish species on the original fish stock. Duration of the ice cover ranged from 90 to 143 days (average 53 days). Maximum temperature of surface water was 32.4C and at 3 m, 24.2C. A distinct correlation was observed between the mean daily wind velocity, air temperature and water temperature. Periods of vertical thermal compensation coincided with drop of air temperature and greater wind velocity. The reverse accompanied the temporary stratification. Among Elodea canadensis stands temperature of water was 0.4-3.0C higher than in the weed-free places. Only during the winter periods were there oxygen losses causing a winterkill depending on meteorological conditions, thickness and structure of ice and snow cover, and

oxygen contents before freezing. The winterkill was very severe in 1969/1970. Lowest visibility was observed in July and August, and highest in autumn and winter. Seasonal and yearly variation of some physical and chemical elements was observed, especially of iron, alkalinity, carbon dioxide, calcium and conductivity. (Jones-Wisconsin)
W75-10094

**PHOSPHORUS RUN-OFF FROM THE DRAINAGE BASIN TO MIKOLAJSKIE LAKE,**
Polish Academy of Sciences, Warsaw. Dept. of Hydrobiology.
T. Gorski, and J. I. Rybak.
Ekologia Polska, Vol 22, No 2, p 275-286, 1974. 1 fig, 3 tab, 67 ref.

Descriptors: *Measurement, *Runoff, *Watersheds(Basins), *Nutrients, Statistical methods, Europe.
Identifiers: *Mikolajskie Lake(Poland), Non-point nutrient sources.

The method for quantitatively estimating the runoff of substances from a drainage basin to water bodies and streams from scattered sources is presented. Using phosphorus as an example, literature data and data on the abundance of phosphorus in the drainage basin of Mikolajskie Lake allowed calculation of the amount of phosphorus runoff from various sources within one year. The calculation is based on following sources of substances (in this instance phosphorus) in-flowing from the drainage basin: surface and groundwater runoff, erosion (water erosion of soil drainage basin, shore erosion, wind erosion), litter fall, substances brought in by animals, substances brought in with precipitation, effect of tourism, and municipal sewage. The drainage basin of Mikolajskie Lake (surface 810 ha) was divided into four parts, each having different biological and geographical parameters. The forest and the towns were separated. The remaining surface of the drainage basin was divided into the area between town and forest, partly with buildings, and partly used for agricultural purposes, and the flat area which was almost entirely used for agriculture. Calculations show that the most significant source of phosphorus is municipal sewage (86.0% of total phosphorus), followed by surface runoff. Other sources are not important. (Jones-Wisconsin)

**PHOSPHORUS KINETICS IN THE EUPHOTIC ZONE OF THE CHESAPEAKE BAY,**
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. L. Taft, and W. R. Taylor.
Available from the National Technical Information Service, Springfield, Va 22161 as COO-3279-08, $4.00 in paper copy, $2.25 in microfiche. Report COO-3279-08 (Undated). 16 p, 9 fig, 8 ref. AEC AT(11-1)3279.

Descriptors: *Phosphorus, *Kinetics, *Euphotic zone, *Chesapeake Bay, Phytoplankton, Growth rates, Cycling nutrients.

There are at least three phosphorus cycles in natural waters. One cycle, the kinetic steady state between phosphorus in phytoplankton and bacteria and dissolved P, is evaluated. The experimental design allowed measurement of the flux of biologically active phosphorus compounds in a living system at ambient nutrient concentrations and reaction rates. It was concluded that when soluble reactive phosphorus concentration is very low, rapid initial P-32 uptake is due to exchange across cell membranes, not to net uptake. The rate constants used for P flux are those for exchange across cell membranes. Michaelis-Menton kinetic experiments frequently evaluate uptake rate by filtration at a single time interval following tracer addition. This practice leads to overestimation of net uptake at low ambient concentrations because some P-32 incorporation is due to exchange. The fraction of uptake due to exchange may be appreciable, demonstrated by Chesapeake Bay data in June, 1973. Since phosphorus appears to limit phytoplankton growth during most of the year in Chesapeake Bay, the slow rate of P-32 uptake may approximate growth rate. It will underestimate growth rate according to the net rate of P uptake from organic molecules and polyphosphates. (Jones-Wisconsin)
W75-10101

**MEASUREMENTS OF ABSOLUTE SCALAR IRRADIANCE SPECTRA IN RHODE RIVER,**
Johns Hopkins Univ., Baltimore, Md. McCollum-Pratt Inst.
W. E. Esaias, W. H. Biggley, and H. H. Seliger.
Available from the National Technical Information Service, Springfield, Va 22161 as COO-3278-24, $4.00 in paper copy, $2.25 in microfiche. COO-3278-24 (Undated). 31 p, 9 fig, 23 ref. AEC AT(11-1)3278.

Descriptors: *Solar radiation, *Measurement, *Spectrometers, *Attenuation, Estuaries, Chesapeake Bay, Phytoplankton, Light intensity, Analytical techniques, Absorption, Wavelengths.
Identifiers: *Rhode River(Md), Scalar irradiance spectra, Turbid waters.

To date there have been no direct measurements of underwater photon scalar irradiance spectra in turbid waters. An attempt to make these measurements by coupling a spherical diffusing collector to an underwater scanning spectrometer is reported. The design and calibration of the instrument and preliminary results obtained in the Rhode River, a subestuary of Chesapeake Bay, are described. The high attenuation in the blue is readily apparent and the attenuation near 680 nm and into the far red. The sharp peak at 700 nm is the result of absorption by chlorophyll at 680 nm and infrared absorption by water at 750 nm, both of which are accentuated by the high scattering. The shape of spectral attenuation curve has been a consistent feature during the past three years of observation. The extremely high total and selective absorptions of sunlight are characteristic of the shallow tributary estuaries of the Chesapeake Bay. The phytoplankton is subjected to extreme ranges of ambient light over short time periods and is strongly selected on the basis of chromatic adaptation. The spectral distribution of light at depth is essentially sunlight minus plant pigment absorption, with additional absorption in the blue by suspended material. (Jones-Wisconsin)

Descriptors: *Photosynthesis, *Absorption, *Phytoplankton, *Carbon, Chesapeake Bay, Inorganic compounds, Cultures, Kinetics, Pyrrhophyta, Cyanophyta, Chlorophyta, Bicarbonates, Nannoplankton, Dinoflagellates, Mathematical studies.
Identifiers: Gymnodinum nelsoni, Prorocentr
minimum, Dunaliella tertiolecta.

Results of a detailed study of C-14 kinetics upt
in natural samples and in unialgal laboratory c
tures are presented. Natural phytoplankton sa
ples from Chesapeake Bay were collected at
0.5 m depth between 1100-1300 h by Van Dorn b
tle or as integrated samples pumped from 0.5
depth along a transect. The laboratory unialgal c
tures consisted of two Pyrrhophyta, Gymnodin
nelsoni and Prorocentrum minimum, c
Cyanophyta, an unidentified unicellular bl
green alga, and Chlorophyta, Dunaliella tertiol
ta. The rates of photosynthetic carbon fixation
natural populations of phytoplankton and for u
algal cultures of species isolated from those po
lations follow hyperbolic saturation kinetics w
respect to total inorganic carbon concentratio
The apparent half-saturation constants, measu
by C-14 uptake, are close to and in some ca
larger than ambient concentrations of total in
ganic carbon. Addition of bicarbonate ion to inc
bation bottles increased the measured C-14 upta
rates by factors as high as 2.5 for natural sampl
and 4.5 for laboratory cultures. There is eviden
that nannoplankton have lower half-saturati
values than larger dinoflagellates. The significa
difference in half-saturation between G. nelso
and P. minimum may have some relationship
their seasonal occurrence. (Jones-Wisconsin)

tion Service, Springfield, Va 22161 as COO-325
16, $4.00 in paper copy, $2.25 in microfiche. AE
COO-3254-16 (Undated). 31 p, 4 fig, 2 tab, 60 re
AEC COO (11-1)3254, NSF GB 19245.

Descriptors: *Periphyton, *Model studies, *Sa
marshes, Population, Nematodes, Algae, Microo
ganisms, Dynamics, Trophic level, Protozoa, Ba
teria, Diatoms, Competition, Niches, Food web
Biological communities.
Identifiers: Foraminifera, Long Island(NY).

For the best part of 5 years, the distribution an
population structure of foraminifera during
growing seasons in a relatively small but ver
productive sublittoral portion of a Long Island sa
marsh have been studied and analyzed. Salt mars
aufwuchs communities are extremely complex a
semblages of more than several hundred species c
bacteria, fungi, algae, protozoa an
micrometazoa. At the present time information o
the population structure is too fragmentary to b
used in modeling and predicting community struc
ture. Studies of foraminifera, nematodes, an
microalgae grown in gnotobiotic culture suggest
is unreasonable to assume that measurement
made on one species will be good estimators fo
similar parameters of other species or the assem
blage as a whole. Nutritional experiments sugges
many meiofauna are selective feeders and gain dif
ferent nutritional values from the food they as
similate. If the phenomena of balanced diets an
special growth factors are widespread amon
meiofauna, it may be necessary to reconsider cer
tain aspects of energy flow modeling. Simulatio
of the trophic dynamics of Allogromia laticollan
was used to organize the information and to serv
as a generator of predictions to be further teste
experimentally. (Jones-Wisconsin)

ble from the National Technical Informa- rvice, Springfield, Va 22161 as AD-785 373, n paper copy, $2.25 in microfiche. Report K) 74-18, September 1974. 84 p, 14 fig, 24 ref, 2 append.

ptors: *Water pollution sources, *Pollution ent, Streams, Lakes, Biomass, Food sing industry, Dissolved oxygen, Fluvial nts, Pesticide residues, Bioindicators, ms, Public health, Sewage treatment, s, Industrial wastes, Sewage effluents, ish, Invertebrates, Toxins, Heavy metals, Water Quality Standards, Water sampling, l properties, Chemical properties, Pesti-

ers: *Loring Air Force Base(Me), Green- ook(Me), Malabeam Lake(Me).

Greenlaw Brook and Malabeam Lake within the periphery of Loring Air Force Base, Maine was studied in June 1973. Surveys indicated the east branch of Greenlaw Brook was chronically polluted by industrial wastes from various base shops. Iron-fixing bacteria were the only living organisms in the upper portion of the stream. Contamination of Malabeam Lake and the west branch of Greenlaw Brook was not considered harmful to human health or aquatic life. The main part of Greenlaw Brook downstream from the sewage treatment plant was polluted with raw and partially treated sewage. This pollution and the industrial waste discharges to the stream's east branch significantly altered the number of organisms and species composition. Game fish could not survive due to invertebrate food supply reduction, breeding habitat elimination, and effects of toxicants and pollutants. It was recommended that industrial waste sources and waste treatment be studied to eliminate future discharges. Water from Malabeam Lake should be studied for a year, fish analyzed for heavy metals, and recommendations made. The sewage treatment plant must be upgraded. The east branch and main part of Greenlaw Brook should be off limits until toxic and inadequately treated discharges have stopped and the environment has recovered. (Buchanan-Davidson--Wisconsin)

**FIELD AND LABORATORY INVESTIGATIONS TO EVALUATE THE INFLUENCE OF NITRILOTRIACETIC ACID (NTA) ON EUTROPHICATION.**
Pacific Northwest Water Lab., Corvallis, Oreg.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 966, $4.25 in paper copy, $2.25 in microfiche. Report May-November 1970. 148 p, 62 fig, 28 tab, 8 ref, 3 append.

Descriptors: *Nitrilotriacetic acid, *Eutrophication, Bioassay, Algae, Lakes, Rivers, On-site investigations, Nitrogen, Phosphorus, Carbon, Plant growth, Primary productivity, Minnesota, North Carolina, Oregon, Chelation, Trace elements, Metals, Sediments, Degradation(Decomposition), Adsorption, Phytoplankton, California, Laboratory tests, Detergents.
Identifiers: NTA.

Field and laboratory investigations were conducted to evaluate the potential impact of nitrilotriacetic acid (NTA) on eutrophication. Studies included laboratory and in situ algal assays on 10 lakes and one river in different geographic areas and of various degrees of water quality. A series of additions (spikes) were made to these waters, including NTA, nitrogen, phosphorus, carbon, secondary sewage effluent resulting from settled primary effluent containing NTA, tertiary treated effluent of the latter, secondary sewage effluent without NTA, and tertiary effluent without NTA. Generally NTA had no dramatic effects on algal growth or primary productivity in Minnesota, North Carolina or Oregon lakes. Where there were stimulatory or inhibitory effects, they appeared to be related to the chelating properties of NTA and interaction with algal trace metal metabolism. Generally the stimulation of algal growth by phosphorus and by secondary sewage effluents was much greater than any stimulation resulting from NTA. There appeared to be an immediate, but slight, disappearance of NTA in lake and river sediments due to adsorption of NTA on particulate matter. After acclimitization there is a rapid disappearance of NTA and results suggest this is due to biochemical (microbial) degradation. (Jones-Wisconsin)

**MEASURES FOR THE RESTORATION AND ENHANCEMENT OF QUALITY OF FRESH-WATER LAKES.**
Environmental Protection Agency, Washington, D.C.

For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $2.85. Report EPA-430/9-73-005, 1973. 249 p, 6 fig, 19 tab, 229 ref, 10 append.

Descriptors: *Water quality, *Water pollution treatment, *Water pollution control, *Lakes, Nutrient removal, Cycling nutrients, Water types, Thermal properties, Public lands, Diversion, Sediment control, Oil wastes, Dredging, Sulfides, Destratification, Ammonia, Aeration, Mercury, Drawdown, Pesticides, Eutrophication, Arsenic compounds, Mechanical control, Biocontrol, Polychlorinated biphenyls, Chemcontrol, Harvesting, Radioactive wastes, Thermal pollution, Management, Water pollution sources, Toxins, Industrial wastes, Municipal wastes, Farm wastes, Mine drainage.
Identifiers: *Lake restoration, Water displacement, Phthalate esters.

Background information on lake environments followed by state-of-the-art information on remedial measures for enhancing and restoring the quality of lakes, ponds, and reservoirs is presented. The approach to the rehabilitation of degraded lakes is twofold: restricting input of undesirable materials and providing in-lake treatment for removal or inactivation of undesirable materials. Reducing or eliminating the sources of waste loading is the only restorative measure needed to achieve desired level of improvement in certain lakes in which natural flushing results in substantial improvements in quality. Remedial measures which restrict the input of contaminants include advanced wastewater treatment, nutrient diversion and allochthonous sediment control. Advanced wastewater treatment probably represents the best method available for curbing nitrogen and phosphorus input to waterways at moderate costs. Nutrient diversion may result in restoration in situations where incoming nutrient load enters from point sources. Useful existence of a water body can sometimes be prolonged by implementing control measures to reduce sedimentation rate. In-lake treatment measures in lake restoration programs now being investigated include dredging, nutrient inactivation, dilution and displacement, covering sediments, artificial destratification, and hypolimnetic aeration and drawdown. In advanced eutrophication stages attempts have been made to control nuisance organisms through mechanical, biological and chemical means. (Jones-Wisconsin)
W75-10122

**THE RECOVERY OF STREAM MACROBENTHOS FROM LOW PH STRESS,**
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
E. E. Herricks, and J. Cairns, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 843, $3.25 in paper copy, $2.25 in microfiche. Presented at The Midwest Benthological Society, 22nd Meeting, March 27-29, 1974. 14 p, 3 fig, 1 tab, 18 ref. OWRR B-034-VA(5).

Descriptors: Acid streams, Aquatic insects, Aquatic animals, Biological communities, Aquatic drift, Water quality, *Virginia, *Hydrogen ion concentration, *Benthos, Water pollution effects, Model studies.
Identifiers: Mill Creek(Va), Recovery(Streams).

The effects of short term low pH stress were studied in relation to recovery and restoration of aquatic macrobenthic communities. Experimental acid additions were made to a healthy productive stream, reducing pH to 4.0 from 8.0 for 15 minutes. Diversity and density were decreased (d 3.91 and 74 organisms/sq ft before acid vs. d 2.79 and 43 organisms/sq ft after acid). Recovery was related to downstream drift of recolonizing organisms; full recovery occurred within 19 to 28 days with density and diversity equaling or exceeding pre-stress values. A second study was made to observe drift born recolonizing organisms. Baetis sp. dominated

drift collections, and was the most abundant taxa in bottom fauna collections indicating a relationship between drift and recovery. Average drift intensity was 10 organisms or less during one 15 minute drift sample; drift rates were calculated to be in excess of 5,000 organisms/day.
W75-10127

**THE EFFECTS OF SELECTED HERBICIDES ON BACTERIAL POPULATIONS IN AN AQUATIC ENVIRONMENT,**
Clemson Univ., S.C. Dept. of Microbiology.
R. N. Ferebee.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 884, $4.75 in paper copy, $2.25 in microfiche. Ph.D. Dissertation, December 1972. 93 p, 15 fig, 10 tab, 70 ref. OWRT A-022-SC(2).

Descriptors: *Bacteria, Aquatic microorganisms, *Herbicides, Pollutants, *Water pollution effects, Culture, Reservoirs, 2,4,5-T, *Paraquat, Ureas, Organic acids, Eutrophication.
Identifiers: *Mesophillic bacteria, *Heterotrophic bacteria, *Diuron.

A laboratory culture system was used to continuously culture mesophilic, heterotrophic bacteria derived from a freshwater reservoir. Alterations in bacterial numbers and diversity of genera were studied both before and after additions of selected herbicides. Identical techniques for isolation and identification were used to compare culturable heterotrophic bacteria from a freshwater reservoir with those in the laboratory culture system. Three chemicals, representing the phenoxyalkonic acid, substituted urea, and dipyridyl classes of herbicides, were added to circulating vat culture vessels which contained untreated reservoir water. At concentrations to 1.4 mg/1, 2,4,5-T did not significantly affect that portion of the bacterial population tested. When the bacteria were exposed to 1.4 mg/1 paraquat there was an increase in counts and evidence for an envirhcment process. Findings following use of this herbicide suggest both direct and indirect effects on the bacterial populations. Diuron (1.4 mg/1) caused rapid increases in total counts with a following decrease. This herbicide also appeared to cause a decrease in genera diversity. The herbicides tested all remained qualitatively measurable in the culture system for three weeks.

**FISH VIRUSES: BUFFERS AND METHODS FOR PLAQUING EIGHT AGENTS UNDER NORMAL ATMOSPHERE,**
Bureau of Sport Fisheries and Wildlife, Kearneysville, W. Va. Eastern Fish Disease Lab.
K. Wolf, and M. C. Quimby.
Appl Microbiol, Vol 25, No 4, p 659-664, 1973.
Identifiers: Atmosphere, Bluegill, Buffers, Carpio, Cells, Channel catfish, Eel, Egtved, *Fish viruses, Hematopoietic, Lymphocystis, Myxovirus, Necrosis, Pancreatic, Plaquing, Rhabdovirus, Viruses, *Plaque assay, *Methodology.

A universal procedure was sought for plaque assay of 8 fish viruses (bluegill myxovirus, channel catfish virus, eel virus, Egtved virus, infectious hematopoietic necrosis virus, infectious pancreatic necrosis virus, lymphocystis virus and the agent of spring viremia of carp (Rhabdovirus carpio), in dish cultures of various fish cells. Eagle minimal essential medium with sodium bicarbonate-CO2 buffer (Earle's salt solution) was compared with minimal essential medium buffered principally with tris (hydroxymethyl) aminomethane or N-2-hydroxyethylpiperazine-N' -2' -ethanesulfonic acid at a pH or in the range of 7.6-8.0 depending upon temperature. Five fish cell lines collectively capable of replicating all fish viruses thus far isolated were tested and quantitatively found to grow comparably well in the 3 media. Two-phase (gel-liquid) media incorporating the various buffer systems allowed plaquing at 15-33C either in partial pressures of CO2 or in normal atmosphere, but greater efficiency and sensitivity were obtained with the organic buffers and, overall, the best results were obtained with tris(hydroxymethyl)-aminomethane. Epizootiological data, specific fish cell line response and plaque morphology permit presumptive identification of most of the agents. At proper pH, use of organic buffers obviates the need for CO2 incubators.--Copyright 1973, Biological Abstracts, Inc.

**BENTHAL DECOMPOSITION OF ADSORBED OCTADECANE,**
Rutgers - the State Univ., New Brunswick. N.J.
H. L. Allen.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No 74-27,578. PhD Thesis, 1974. 351 p.

Descriptors: *Oil pollution, *Water pollution effects, *Dissolved oxygen, Benthos, Environmental effects, Oil wastes, *Biodegradation, *Degradation(Decomposition), Adsorption.
Identifiers: *Octadecane.

An experimental flowing stream system was designed to test the environmental impact of octadecane, a significant component of crude oil. It is known that the long term adverse effects of oil pollution are primarily the destruction of the benthos by deposited oil and the reduction in dissolved oxygen concentration. The process involves both aerobic and anaerobic phases. This research attempted to characterize the behavior of a benthic deposit containing octadecane under varying conditions of seed concentration, flow rate, dissolved oxygen concentration, surface area, nutrient concentration, and salt concentration, and to determine rate controlling factors. Its objective was also to determine the relationship between the benthal decomposition of adsorbed octadecance and the overall oxygen uptake to the benthal deposit. It was found that: decomposition of suspended octadecane proceeds at a rate about 1.10 that of sewage; benthal oxygen uptake rate is a function of initial seed volatile concentration at the deposit surface; the effect of flow rate is partly attributed to the base activity of the deposits and partly to the adsorbed octadecane on the nature of the deposit-water interface; low nitrogen levels inhibit benthal oxygen uptake but low phosphaorus levels do not; and both the benthal oxygen uptake rate at constant flow and the effect of flow rate on uptake rate are functions of the reciprocal surface area of confined deposits. llution control, *Sewage treatment,
llution, Powerplants, Cooling, Aera-
, Waves(Water), Turbulence.
Translatory waves.

on pertains to cooling water effluent
generation stations to prevent thermal
natural bodies of water and in another
pertains to a more efficient method of
d treating sewage. A process is
r treating a body of water to cool and

to increase the dissolved oxygen content of the water by producing controlled translatory waves in the body of water. The process includes storing water in a reservoir at a selected height above the level of the body of water, periodically releasing specified quantities of water from the reservoir at a point below the level and in an upward direction toware the surface and into the body of water. The upward direction of the released water is accomplished by releasing the water against a deflector located near the base of the reservoir. The released water forms a translatory wave in the body of water and as it moves away from the reservoir, it breaks causing effective mixing of air and water, cooling the water and increasing the oxygen content of the water. The translatory wave produced is referred to a plunger breaker type. In this type of wave, the waves curl over in breaking enclosing an air pocket which explodes during the breaking process. This action accomplishes excellent mixing of air and water and where solid particles are present, breaking and pulverizing of the particles. (Sinha-OEIS)
W75-09874

**MAKING ACTIVE CARBON FROM SEWAGE SLUDGE,**
Combustion Engineering, Inc., Windsor, Conn. (assignee)
R. D. Nickerson, and H. C. Messman.
US Patent No 3,887, 461, 3 p, 1 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 935, No 1, p 293, June 3, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Waste disposal, Separation techniques, *Activated carbon, Adsorption, Water pollution treatment.
Identifiers: Pyrolitic treatment.

Sewage is subjected to primary treatment which includes allowing solids to settle out in a settling tank, and conveying the solids to a dryer where they are at least partially dried by hot gases. The sewage water moves on to a subsquent treatment tank where it can be treated with further additives. The solids are subjected to pyrolitic treatment in a furnace at temperatures within the range of 500 deg C-1000 deg C by passing a stream of hot gases through it. Active carbon and char are formed. The active carbon is separated from the char by entraining it in the gases leaving the furnace. The gases discharged from a fluidized bed pass through a wet scrubber where the fine carbon particles carried along in the gas stream are separated out. The separated carbon particles are relatively pure active carbon. The carbon slurry is recycled to the sewage system to absorb impurities from the sewage and to improve the quality of primary effluent. (Sinha-OEIS)
W75-09875

**METHOD FOR PURIFYING WASTE WATER,**
T. Minegishi.
US Patent No 3,888,751, 4 p, 6 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 935, No 2, p 721, June 10, 1975.

Descriptors: *Patents, *Waste water treatment, *Water purification, *Water pollution control, *Electrolysis, Industrial wastes, Coagulation, Flocculation, Filtration, Separation techniques.

A method and device is described for purifying waste water by subjecting the water to a localized water electrolysis for the promotion of the flocculation of the solid waste material and its subsequent removal. Electrodes are positioned within a tubular member located within a vessel containing the waste water and the waste water is introduced into an electrolysis area located between two spaced electrodes which are subjected to a direct current potential. The incoming waste water is subjected to the action of the newly formed oxygen and hydrogen of the electrolysis process to cause a formation of nuclei which creates the flocculation or coagulation of the waste materials so that they are quickly separated from the water. The inorganic particles which are present in the waste water, particularly protein starch powder, fat, heavy metal, etc are coagulated so as to form separable balls of the material which may be made to float on the water surface of the vessel and which may be easily separated from the purified water and collected. (Sinha-OEIS)
W75-09882

**SEWAGE TREATMENT TANK,**
P. D'Aragon.
US Patent No 3,888,767, 3 p, 6 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 935, No 2, p 726, June 10, 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Sewage treatment, *Aerobic treatment, *Anaerobic digestion, Aeration, Septic tanks, Water pollution sources.
Identifiers: *Sewage treatment tanks.

The invention relates to a sewage treatment tank for the treatment of sewage from houses, hotels, garages, schools, and small industries where normal sewage collector systems do not exist. The sewage tank contains no mechanically moving parts and is composed of two adjacent compartments. In the first compartment most of the solids are separated from the liquids and are digested by anaerobs. The effluent passes to the second compartment where it is submitted to the action of aerobs in the presence of injected air. There is a pipe in each compartment adjacent to the wall separating the compartments. These pipes contain a plurality of holes in their upper portion which permits the continuous evacuation of gases produced in both the compartments. Both pipes also permit the removal of digested sediments from the compartments through the base of the pipes at predetermined intervals. The tanks may be made of many materials. Wood rendered impervious or plastics are both satisfactory materials. (Sinha-OEIS)

T. Techima, T. Nagasao, M. Tanaka, K. Ariga, and K. Inoue.
US Patent No 3,888,756, 5 p, 9 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 935, No 2, p 723, June 10, 1975.

Descriptors: *Patents, *Water purification, *Water pollution treatment, Water quality control, Demineralization, Industrial wastes, *Electrolysis, Electrodes, *Waste water treatment, Water treatment.

An apparatus is provided for treating drinking water or waste water containing impurities by the use of an electrolytic cell. The apparatus contains at least one pair of main electrodes opposed in the electrolytic cell to each other; a power source connected to the main electrodes; and a number of auxiliary electrodes places in pieces between the main electrodes. The auxiliary electrodes are uniformaly arranged in a mutually close relationship but insulated by nonconductive materials between the main electrodes so as to avoid any short circuit between the main electrodes. The nonconductive materials are placed in pieces so as to form a mixed filler layer together with the auxiliary electrodes. The nonconductive materials may be porous plastic holders. (Sinha-OEIS)

Identifiers: Solidification, *Waste fixation.

Radioactive waste fission products and residual actinides in chemical processing plant wastes need to be isolated from biological processes until the radionuclides decay to innocuous levels. A promising method for effecting isolation is to convert the wastes to a highly insoluble material for final storage. The product should be inert for maximum immobility regardless of storage mode during the long-term and any interim storage. Naturally-occurring systems that may yield suitable product forms are the aluminosilicate mineral groups which form much of the earth's crust. Methods being investigated convert nuclear waste into crystalline aluminosilicate minerals wherein each of the nuclide cations are contained within individual molecular cages that constitute the crystal lattices. The literature pertinent to immobilization of cations by silicates, with emphasis on aqueous systems, was reviewed. This report summarizes the literature and includes a bibliography of about 600 references to assist other investigators. References are classified under the following groups: Clay materials, Structure, Technology and Chemistry, Absorption and Ion exchange. Cation Exchange, Fixation, and Diagenesis.

FAUNAL RESPONSE TO SPRAY IRRIGATION OF CHLORINATED SEWAGE EFFLUENT,
Pennsylvania State Univ., University Park. School of Forest Resources.
G. W. Wood, P. J. Glantz, D. C. Kradel, and H. Rothenbacher.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 678, $4.75 in paper copy, $2.25 in microfiche. Pennsylvania Institute for Research on Land and Water Resources University Park. Research Publication No. 87, June 1975, 89 p, 41 tab, 5 fig, 74 ref, append. OWRT B-059-PA(5). 14-31-0001-3932.

Descriptors: *Sewage effluents, *Irrigated land, Sludge, Wildlife, Mammals, Birds, E. coli, Mosquitoes, Song birds, Deer, Habitats, Microbiology, Chlorination, Water reuse, Recycling, Water pollution effects.
Identifiers: *Waste water irrigation, *Cottontail rabbit, Non-irrigated land, Sludge-injected effluent, Tissues analysis, Microbiological examination, Spray irrigation.

The only significant difference found in a 3-year comparison of cottontail rabbit populations confined to non-irrigated and sewage effluent irrigated aspen-white pineshrub habitat was in the significantly heavier body weights in the fall of juveniles on irrigated sites. Comparisons of spring and fall populations of mice in non-irrigated, effluent irrigated, and sludge-injected effluent irrigated mixed-oak forest habitat were made. Analyses of liver, kidney and bone tissues for cadmium, chromium, copper, nickel, lead and zinc were done on cottontail rabbits from effluent irrigated and non-irrigated sites. Whole-body analyses of dry ashed white-fotted mice carcasses for chromium, nickel, lead, and zinc were also made. Studies of the effects of effluent irrigation on production, nutritive quality, and use of deer forages in mixed-oak forest stands were done. Studies of songbirds revealed that their use of irrigated areas declined during the time of irrigation. A limited investigation of the influence of wastewater irrigation on disease incidence in several species of wild animals was done. Microbiological examination of the wastewater for total coliform, fecal coliform and fecal streptococci was done. (Sink-Penn State)

ADVANCES IN AMMONIA AND NITRATE REMOVAL,
Dravo Corp., Pittsburgh, Pa.
E. S. Savage.
Industrial Water Engineering, Vol 11, No 4, p 12-16, July/August, 1974. 8 fig.

Descriptors: *Nitrogen, *Ammonia, *Industrial wastes, *Municipal wastes, *Waste water treatment, Toxicity, Eutrophication, Chlorine, Corrosion, Biological treatment, Denitrification, Microorganisms, *Nitrates.
Identifiers: Dravo Denite System.

Nitrogen present in industrial and municipal effluents can cause problems of toxicity, oxygen sag, eutrophication, chlorine demand, and corrosivity. Biological reduction of nitrates commonly occurs in waste treatment plants as a result of the action of facultative microorganisms which utilize oxygen from nitrates when the dissolved oxygen levels are too low. This naturally occurring process can be controlled and optimized for biological denitrification systems. Columnar denitrification, one type of system, is characterized by the fixed positioning of denitrifying bacteria in a packed column. Denitrification and suspended solids removal can be accomplished simultaneously in the same equipment. However, fouling of the denitrification filters and breakthrough of nitrate into the effluent at peak hydraulic rates or during low temperatures can also occur. The Dravo Denite System is described; the main components are the filter bottom, media, and control system. Its filter hardware can accommodate high loadings of suspended solids without excessive head loss and can backwash the high loadings from the filter without gradual fouling of the media and control system. The M-block filter bottom has inherent advantages in design, installation, and operation. Selection of the proper denitrification media depends on size, uniformity, density, and hardness. Automatic operation of the control system is recommended for the nitrogen purge cycle and for filter backwashing. The other controls should be as simple as possible without losing reliability and performance. (Orr-FIRL)

CARBON CONTACT-FILTRATION: HOW IT WORKS,
Seelye, Stevenson, Value, and Knecht, New York.
C. R. Lee, and T. Takamatsu.
Water and Sewage Works, Vol 121, No 8, p 84-87, August 1974. 9 fig, 1 tab, 20 ref.

Descriptors: *Activated carbon, *Waste water treatment, *Adsorption, *Tertiary treatment, Costs, Mathematical models, Chemical reactions, Separation techniques, Capital costs, Operating costs, Construction costs, Cost analysis, Cost comparisons, Maintenance costs.

Activated carbon treatment is used to remove dissolved organics or inorganics. The mechanism of removal can be adsorption which actually removes the dissolved organics from the solution and/or bio-oxidation of the adsorbed organics. The mechanism of adsorption is discussed. Physical adsorption results from inter-molecular forces of attraction. Chemical adsorption results from the formation of chemical bonds between molecules of the adsorbate and adsorbent. The sorption equilibrium depends on the concentrati of the materials, gas pressure, and temperatu Equations developed by Freundlich and Longm are presented. The theory of contact-filtration also discussed. Three modes are considered--s gle-stage system, multi-stage current flow syste and multi-stage counter-current flow syste Waste treatment cost is classified into two grou capital cost including construction, land, engine ing and contingency; and, operation and ma tenance cost including fuel, power, maintena materials and labor. When considering carb treatment costs, carbon inventory is included the capital cost and the make-up carbon and c bon regeneration costs are included in the ope tion and maintenance cost. A cost analysis presented for the actual expenses for carbon tre ment incurred at a South Tahoe, Nevada, wa reclamation plant during 1969 and 1970. Eq tions, figures, and graphs are used to illustrate penses and comparisons of costs. (Orr-FIRL)

CHARACTERIZATION OF MIXING AERATED LAGOONS,
McMaster Univ., Hamilton (Ontario). Dept. Chemical Engineering.
K. L. Murphy, and A. W. Wilson.
Journal of the Environmental Engineering Di sion, American Society of Civil Engineers, V 100, No EE5, p 1105-1117, October 1974. 7 fig tab, 18 ref.

Descriptors: *Aerated lagoons, *Waste wa treatment, *Mixing, Mathematical models, Ae tion, Oxygenation, Sewage treatment, *Oxidati lagoons.
Identifiers: Continuous Stirred Tank Reactor, Pl Flow Tubular Reactor.

Aerated lagoons have evolved from waste s bilization pond design as economical methods secondary treatment of large volumes of waste. rational approach for use in characterizing mixing behavior of aerated lagoons is presented. is generally assumed that an aerated lago behaves like a completely mixed reactor. The t idealized mixing extremes are the Plug Flow Tub lar Reactor (PFTR), a hypothetical vessel whe the fluid enters at one end and moves down vessel in uniform piston-like flow to the exit a the Continuous Stirred Tank Reactor (CST where mixing is so intense that no concentrati gradients exist and the concentration of the e stream is equal to the concentration at any point the vessel. Variations of these models and othe were fitted to tracer data taken from prototy aerated lagoons. The following conclusions we drawn from an analysis of the experimental da mixing patterns in aerated lagoons may differ si nificantly from the assumptions of either ide complete mixing or ideal plug flow; macromixi levels in aerated lagoons are more dependent upo lagoon geometry than upon aerator horsepow input over the range studied; dimensionless dispe sion number which characterizes the degree macromixing depends only on the lagoo geometry and flow rate; and the overall pe formance of aerated lagoons may be evaluate using the relatively simple unequally-sized CST in-series model. lew Jersey, *Treatment facilities.

ve municipalities of Hamilton Township,
Windsor Township, Washington Township,
gh of Allentown, and part of the Township
per Freehold, all in the central part of New
have joined together in a sewage disposal
plan. The plan is technically, economically,
ally, and administratively attractive and is
ed to provide service for anticipated needs
ars from today. Two stage expansion of the
water treatment plant in Hamilton
hip is planned. The first stage would include
igh-rate trickling filter section for seconda-
gical treatment, additional digested sludge
, improvements to the post-chlorination
s and the recirculation pumping system in
tion of secondary treatment, construction
iles of interceptor sewers, 3 pumping sta-
d 4 miles of force mains, and a pumping
and force main to transport the treated ef-
lirectly to the Delaware River, about one
m the main treatment plant. The expansion
rease the capacity of the plant to 11 mgd.
cond stage of improving the waste water
nt includes a further expansion of the
nt plant capacity to 30 mgd, an increase in
g capacity, and the construction of five
ajor interceptors. The system is expected
mpleted by 1990. (Orr-FIRL)

, p 2362-2371, October 1974. 3 fig, 2 tab,

rs: *Waste water treatment,
ts, *Phosphates, *Domestic wastes,
acetic acid, Water pollution sources.
: *Trisodium nitriloacetate, NTA.

l field test was performed to determine
radability of trisodium nitrilotriacetate
a domestic waste water treatment
e test was conducted over a three year
the Elm Farm Mobile Home Park near
ge, Va. The waste water treatment plant
of a 25,000 gallon mixed liquor basin,
aerated and mixed by an aerator driven by two 2.5 hp compressors. The mixed liquor is displaced to a conical clarifier through a submerged line to the clarifier's stilling well. The treated waste water is released to a stream; the waste sludge is disposed of on tilled land. The first release of the detergent to the community resulted in two findings: the total phosphorus in the treated waste water dropped from 18 to 20 mg/liter to 10 mg/liter in the first week and continued downward through the following weeks to a steady low of around 8 mg/liter; and, the community used much more of the detergent than was expected. The initial results indicated that the plant was unable to acclimate itself to shock concentrations of NTA. The detergent was again released to the community and the phosphorus and NTA levels were monitored. The results of this part of the study indicated that the plant influents had acclimated to 40 mg/liter NTA and consistently yielded effluents in the range of 0.3 to 1.0 mg/liter NTA. Good performance of the system was also shown by MBAS concentrations of less than 0.5 mg/liter and DOC reductions of 70 percent in the effluent. (Orr-FIRL)

**BIOLOGICAL PURIFICATION OF WASTE WATER AND SEWAGE.**
French Patent 11433W/07. Issued December 20, 1974. Derwent French Patents Report, Vol W, No 7, p 3, March 25, 1975.

Descriptors: *Waste water treatment, *Patents, *Biological treatment, *Sewage treatment, Oxidation, Sludge treatment, Aeration, Aerobic treatment, Bacteria, Treatment facilities.
Identifiers: Extended aeration.

A biological treatment process for waste water and sewage coming from small and medium sized communities involves total oxidation (extended aeration). Crude effluent is admitted directly into an oxidation-settlement tank which is equipped with a floating turbine to stir and homogenize the medium with an intense introduction of oxygen. This causes direct oxidation, allowing aerobic bacteria to live and multiply. After the aeration phase, the turbine is stopped and settlement takes place. The sludge falls to the bottom and the upper layer rapidly becomes limpid; it is evacuated through an automatic overflow valve. After the evacuation of the purified water, the valve closes and the plant may begin another cycle. (Prague-FIRL)

**AERATING EFFLUENT AND KEEPING SLUDGE IN SUSPENSION.**
French Patent 57251V/32. Issued September 27, 1974. Derwent French Patents Report, Vol 47, No 5, p 3, December 31, 1974.

Descriptors: *Patents, Aeration, Effluents, Suspensions, Sludge, Jets, Waste water treatment, Flow, Activated sludge.

Effluent is aerated and activated sludge is held in suspension by jets of water obliquely striking the surface. The vessel used may be circular, eliptical or polygonal in plan and is of constant cross-section through the greater part of its height. Jets strike the surface at not more than 60 degrees, preferably 10 to 20 degrees to the surface with a speed of between 3 to 12 m/sec (preferably 4 to 8 m/sec). The horizontal component of the tangent is in the general direction of the flow. (Prague FIRL)

**SEWAGE AND EFFLUENT BIOLOGICAL TREATMENT PROCESS.**
Belgian Patent 82653V/48. Issued November 4, 1974. Derwent Belgian Patents Report, Vol 5, No 48, p 2, January 7, 1975.

Descriptors: *Sewage treatment, *Patents, *Oxygen, Biological treatment, Effluents, Valves, *Waste water treatment, Liquids, Tanks, Separation, *Oxygenation.
Identifiers: Countercurrents.

A sewage and effluent biological treatment process uses oxygen in counter-current flow with liquid containing suspended oxidizable matter. The plant facility is designed for activated sludge treatment of sewage, industrial effluents and fermentation liquors. Liquid to be treated enters a series of covered oxygenation tanks; these communicate with each other through openings in the separating partitions. Automatic valves control the oxygen content of the gaseous phase, held at a predetermined value. Oxygen or air enriched with oxygen circulates counter-current to the liquid. The treated liquid leaves the last tank to pass into a separating tank from which the settled sludge is recycled back to the first tank. With regular oxygen feed into the various tanks, better operating conditions result: consumption of oxygen is reduced; the energy balance is improved; and the dimensions of the settlement tank can be reduced. **FREEZE CRYSTALLIZATION: NEW WATER-PROCESSING TOOL,**
N. R. Iammartino.
Chemical Engineering, Vol 82, No 13, p 92-93, June 23, 1975. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Cooling towers, Pulp and paper industry, Water reuse, Potable water, Costs, Water purification.
Identifiers: *Freeze-crystallization, *Crystalex process, Electroplating wastes.

The Crystalex process has been developed by Avco Systems Division for use in purifying a wide range of industrial wastes such as electroplating wastes, cooling-tower blowdown, pulp mill bleach streams, and various inorganic and organic waste streams. The Crystalex process is a freeze-crystallization technique based on the principle that ice crystals formed by freezing in an aqueous medium are always pure. The mechanics of the process plus a schematic illustration are discussed. The Crystalex process can recover up to 95 percent of the influent as pure water for reuse. Production of potable water and recovery of valuable products are other uses of this process. Advantages of the process include: minimization of corrosion problems and construction materials cost by running at low temperatures and avoiding heat-transfer surfaces in the crystallization stage; elimination of costly pretreatment; consumption of a modest amount of energy; and, production of a high water recovery ratio. The installed cost of a 100,000 gal/day crystalex module is estimated at $400,000-650,000; significant economies of scale exist. (Orr-FIRL)

**JOINT TREATMENT OF PULPING AND MUNICIPAL WASTES,**
Procter and Gamble Co., Cincinnati, Ohio. Environmental Control Section.
C. A. Barton, J. F. Byrd, C. R. Faulkender, and O. H. Moss.
Journal Water Pollution Control Federation, Vol 47, No 5, p 998-1004, May 1975. 1 fig, 3 tab, 4 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Municipal wastes, *Activated sludge, Cost allocation, Pulp and paper industry, Effluent, Treatment facilities, Wisconsin.
Identifiers: *Contact stabilization, Green Bay(Wisc), *Combined treatment.

The City of Green Bay, Wisconsin, the Charmin Paper Products Company, and the American Can Company are involved in the construction of a $60 million treatment plant for their combined wastes. The plant will be an activated sludge facility utilizing contact stabilization. It will be ready for start-up in 1975. The cooperation between the city, the mills, and the Green Bay Metropolitan Sewerage District in developing the contracts and financial arrangements for the joint treatment system is described. The rate structure, or cost allocation, was developed to depend on each mill's flow, BOD, and SS load. The final rate each year will reflect actual load as developed from the annual audit of the District's financial records. Basically, the contract between the city, the mills and the district states that the District will provide adequate treatment of the pulp mill effluent, the city will collect the sewer service charges, and the individual mills will pay their share of the operating costs based on actual loads and their share of the capital cost based on the design loads. (Orr-FIRL)
W75-09928

**MUNICIPALITY AND INDUSTRY JOIN IN WASTEWATER TREATMENT.**
Public Works, Vol 106, No 5, p 89-90, May 1975. 2 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Pulp and paper industry, *Municipal wastes, Activated sludge, Filters, Incineration, Cost allocation, Cities, Treatment facilities, Sludge, Ohio.
Identifiers: Hamilton(Ohio), Champion International, Paper mills, Vacuum filters, Fluid bed incinerator, *Combined treatment.

The City of Hamilton, Ohio, and the nearby paper mills of the Ohio Division of Champion International are constructing a waste water treatment facility for their combined wastes. The joint plant represents major savings in capital investment and operating costs for both the city and company. The facility will be an activated sludge plant consisting of aeration tanks and final clarifiers, with effluent aeration and five vacuum filters for dewatering the city's primary sludges, plus all secondary sludges generated, followed by incineration of the sludges in a fluid bed incinerator. The completed plant will be able to process 72,000 lbs dry solids per day and a maximum anticipated 1985 peak load of 32 mgd of waste water. Capital costs will be based on flow, BOD loading, sludge loading and an average weight factor of associated capital costs. Operating costs will be based on the actual loads. The present projected construction cost is $13 million; the completion date is late 1976. (Orr-FIRL)
W75-09929

**VACUUMING WASTE FROM WATER.**
American Machinist, Vol 119, No 11, p 52, June 1975.

Descriptors: *Waste water treatment, *Industrial wastes, Treatment facilities, Coolants, *Filters, Sludge disposal, Rivers, Landfills, Effluents, Dewatering, Equipment, *Filtration, Illinois, Separation techniques.
Identifiers: *Vacu-matic sludge filters, Oil-sludge particles, Chemical treatment.

International Harvester's East Moline, Illinois plant has recently installed a $500,000 waste water treatment facility. The facility treats contaminated machine coolant and other liquids, separating the filtered water which is pumped into the river from the sludge waste which is disposed of in a landfill. The contaminated water comes from a variety of machines and processes including lathes, drilling machines, paint preparation area, milling and hobbing equipment, saws and cutoff machines, and wash booths. The waste water is first channeled to large underground collection tanks. It is then piped to two settling tanks where floating oil-sludge particles are skimmed from the surface. The effluent is transferred to a floatation tank where chemicals are added and the resultant sludge is skimmed and dewatered for hauling. Chemical treatment consists of the addition of lime, alum, and an anionic polyelectrolyte. Dewatering of the sludge is accomplished with the aid of a Vacu-matic sludge filter. The sludge filter has a relatively large filtering zone for effective sludge cake generation. The filtering media does not have to be separated from the sludge because it is made of paper and decomposes in the landfill. The installation is capable of processing 54,000 gal of contaminated liquid every 24 hours. (Orr-FIRL)

**POLLUTION ABATEMENT IN THE PHA MACEUTICAL INDUSTRY,**
National Environmental Research Center, Edis N.J. Industrial Waste Treatment Research Lab
P. B. Lederman, H. S. Skovronek, and P. E. DesRosiers
Chemical Engineering Progress, Vol 71, No 4 93-97, April, 1975. 5 tab, 19 ref.

Descriptors: *Waste water treatment, *Industr wastes, Biological treatment, Activated sludg Aerated lagoons, Trickling filters, Treatme facilities, Adsorption, Reverse osmosis, Filt tion, Coagulation, Sedimentation, Chemi wastes, *Pollution abatement, Organic wastes.
Identifiers: *Pharmaceutical wastes, Ozone tre ment, Toxic wastes.

Pollution abatement in the pharmaceutical indu try is discussed. A summary is presented of study initiated in 1972 by the Pharmaceuti Manufacturers Association (PMA) to compile formation on the sources, volumes, and chara teristics of the industry's wastes, current tre ment processes, and future treatment needs. T industry's wastes were segregated into: formu tion/packaging; chemical synthesis; fermentatio biological products, and, extraction of natu products. Many generalities were made for each these segments but precise waste volumes, chara teristics or treatability could not be determine Biological treatment practices are commonly us for both on-site complete treatment, and pre-tre ment before discharge to a municipal facility. A tivated sludge and aerated lagoons are replacin the trickling filters used in older treatment faci ties. The general conclusion is that differe biological treatment methods, together wi segregation of strong or toxic wastes, neutraliz tion, and conventional coagulation and sediment tion, are capable of obtaining about 90 perce removal of BOD5 for all types of pharmaceutic wastes. The cost of the waste water treatment w found to range from $0.76/1000 gal to $2.27/10 gal. Future treatment needs include the use of a vanced waste water treatment processes such carbon adsorption, reverse osmosis, ultrafiltr tion, and ozone treatment, as well as mo research on ultimate disposal and/or resour recycling. **RECOVERING ORGANIC MATERIALS FRO WASTEWATER,**
Rohm and Haas Co., Philadelphia, Pa.
B. W. Stevens, and J. W. Kerner.
Chemical Engineering, Vol 82, No 3, p 84-8 February, 1975. 2 fig, 1 tab, 10 ref.

Descriptors: *Waste water treatment, *Industri wastes, *Polymers, Adsorption, *Chemic wastes, Costs, Activated carbon, Organic com pounds, Solvents, *Organic wastes, Separatio techniques.
Identifiers: *Pharmaceutical wastes, Nontherm regeneration, *Recovery(Organic wastes).

The use of polymeric adsorbents for separatin and recovering organic compounds from chemic and pharmaceutical waste waters has been rapid increasing. Polymeric adsorbents permit no destructive adsorption, which allows recovery costly or short-supply products, and nontherm regeneration, which reduces fuel bills. A com parison of polymeric adsorbents with activate carbon is made. Polymeric adsorbents are good f both polar and nonpolar material, while activate carbon is good only for nonpolar substances. Bin ing energies of polymeric adsorbents are lowe than those of activated carbon for the same o ganic molecules, thus requiring smaller energy i puts for desorption. Solvent regeneration polymeric adsorbents is most effective when pe formed in situ. Careful selection of the solvent wi permit the recycling of a regenerant stream lade with an adsorbed organic compound thereby form ing a closed-loop, materials-recovery proces

Capital costs of polymeric adsorbent systems are comparable to those of activated carbon. Operating costs are less for polymeric adsorbent systems than for carbon systems when the concentration of dissolved organics is high. (Orr-FIRL)

TRUCTION OF SPENT OIL-WATER ULSIONS--USING INCANDESCENT COKE ORE QUENCHING,
ian Patent 22521W/14. Issued March 3, 1975.
vent Belgian Patents Report, Vol W, No 14, p ay, 1975.

riptors: *Waste water treatment, *Industrial es, Metals, *Patents, Oily water, Emulsions, ater interfaces.
ifiers: *Oil-water emulsions, Rolling mills, ace finishing plants, Coke.

destruction of spent oil-water emulsions is aclished by applying the emulsions or residues ned from such emulsions to the surface of inescent coke after it has been discharged from ven but before it has been quenched. The sion or its residue is applied from a pipe openbove the surface of the incandescent coke. This method provides an inexpensive way of disposing of large quantities of oil-water emulsions from metal processing plants such as rolling mills or surface finishing plants. Part of the material may be recovered through this technique. Iron turnings derived from metal processing do not interfere with the process and the metal is recovered when the coke is used in a blast furnace or cupola. The method is successful with residues containing oil in an amount equal to or less than 70 percent. (Orr-FIRL)

MEMBRANE PROCESSING IN THE METAL FINISHING INDUSTRY,
Abcor, Inc., Cambridge, Mass. Walden Research Div.
R. L. Goldsmith.
Transactions of the ASME, Journal of Engineering for Industry, Vol 97, No B-1, p 238-245, February, 1975. 4 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Membrane processes, *Reverse osmosis, Filtration, Coolants, Effluents, Incineration, Oil, Water reuse, Metals.
Identifiers: *Metal finishing industry, *Ultrafiltration, Electroplating wastes, Oily wastes.

Two important applications of membrane processing in the metal finishing industry are the use of reverse osmosis (RO) for electroplating waste treatment, and ultrafiltration (UF) for concentration of oily wastes before disposal. Reverse osmosis can be used for the closed-loop treatment of plating bath rinse waters with recycle of the plating chemicals and reuse of the purified water in rinsing operations. Closed-loop RO for treatment of segregated rinse waters and for treatment of mixed effluents are discussed in detail with reference to the advantages and limitations of each. In the treatment of waste-oil emulsions by UF, water and some low-molecular weight materials pass through the membrane, while the emulsified oil droplets and suspended particles are retained, concentrated, and continuously removed. UF is capable of concentrating emulsions to greater than 50 percent oil. These can be incinerated without the addition of fuel, or the oil can be reused by upgrading it to a fuel or lubricant. Data are presented for the UF concentration of several spent oil-containing coolants. (Orr-FIRL)

FACTORS INFLUENCING REVERSE OSMOSIS REJECTION OF INORGANIC SOLUTES FROM AQUEOUS SOLUTION,
Ford Motor Co., Dearborn, Mich. Scientific Research Staff.
M. E. Heyde, C. R. Peters, and J. E. Anderson.
Journal of Colloid and Interface Science, Vol 50, No 3, p 467-487, March, 1975. 5 fig, 7 tab, 65 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Reverse osmosis, *Membrane processes, Separation techniques, Aqueous solutions.
Identifiers: Cellulose acetate membranes, Partition coefficients, Electrical charge.

The potential use of reverse osmosis in a variety of waste water applications is discussed. The factors influencing reverse osmosis rejection of inorganic solutes from aqueous solution were examined with emphasis on the partition coefficients of inorganic compounds between water and cellulose acetate membranes. Electrical charge is the most important factor governing the cellulose acetate/water partition coefficients of electrolytes. The mean membrane/water partition coefficients of ions decrease with increasing solute charge, and increase with increasing ionic size. The effective charge of a salt does not necessarily correspond to its normal valence. The pH of the external solution alters the concentration of fixed membrane charges by shifting the equilibrium between ionized and unionized carboxyl groups on the membran are ion-pairing with H3O+ or OH- changes the effective solute charge. Concentrated salt solutions produce swelling or shrinkage of both homogeneous, fully dense cellulose acetate membranes and the surface skin of asymmetric cellulose acetate films. The membrane/water partition coefficients of electrolytes as well as their reverse osmosis rejection can be correlated with other physical measurements and with the lyotropic series. A comprehensive experimental basis is presented for understanding the mechanism of reverse osmosis rejection by cellulose acetate membranes. The results of this work may be used to predict reverse osmosis behavior under experimental conditions. (Orr-FIRL)

TREATMENT OF AQUEOUS WASTE STREAMS WITH HYDROGEN PEROXIDE TO REMOVE CHLORINATED ISOCYANURATES THEREFROM,
FMC Corp., New York. (assignee).
R. H. Carlson, R. N. Mesiah, and H. R. Chancey.
United States Patent 3,878,208. Issued April 15, 1975. Official Gazette of the United States Patent Office, Vol 933, No 3, p 1369, April, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, Chemical wastes, Pollution abatement, Water pollution control.
Identifiers: *Chlorinated isocyanurates, Hydrogen peroxide, Dechlorination.

The manufacture of chlorinated isocyanurates results in a waste water stream with a pH from 0.5 to 7.0, containing dissolved chlorinated isocyanurate. A treatment method for such waste streams is described. The streams are treated with hydrogen peroxide at a pH of 0.5 to 12.0. This causes a dechlorination of the contaminating chlorinated isocyanurate. A precipitation and subsequent recovery of the isocyanurate is then effected. (Orr-FIRL)

PROCESS FOR TREATING WASTE PHOTOGRAPHIC PROCESSING SOLUTIONS,
Fuji Photo Film Co., Ltd., Kanagawa (Japan). (assignee)
I. Shimamura, and H. Iwano.
United States Patent 3,869,383. Issued March 4, 1975. Official Gazette of the United States Patent Office, Vol 932, No 1, p 228, March, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, Ion exchange, Resins, *Patents, Chemical wastes, *Anion exchange.
Identifiers: Photographic processing solutions, Ferricyanides, Buffering compound.

A process is described for the treatment of waste photographic processing solutions containing ferricyanide and/or ferrocyanide ions. The waste solution, pH 7-9, is contacted with a weakly basic anion exchange resin in the free base form in the presence of a buffering compound. The buffering compound is added in an amount sufficient to maintain a buffering action at a pH of 7-9. The ferricyanide and ferrocyanide ions are thereby adsorbed on the anion exchange resin. FLUIDIZED-BED INCINERATION OF URBAN SLUDGE (INCINERATION DES BOUES URBAINES EN LIT FLUDISE),
M. Tamalet.
Revue Generale de Thermique (Paris), No 150/151, p 511-517, June/July, 1974. 9 fig, 1 tab.

Descriptors: *Municipal wastes, *Sludge treatment, Waste water treatment, *Incineration, Costs, Combustion, Urban drainage, Waste disposal.
Identifiers: *Fluidized-bed incineration, Urban sewage sludge.

A method and the equipment for the fluidized-bed incineration of urban sewage sludge are described. A sand fraction of 0.5-2.0 mm is used as a fluidized medium. The sewage sludge is injected at the top of the fluidized-bed reactor to obtain lumps about 20 mm in size which then are heated rapidly. The prevention of malodorous emissions requires a minimum reactor temperature of 800 C. Incineration takes place in a temperature range of 800-850 C at an excess-air coefficient of 20 percent. The combustion products are carbon dioxide, water, and mineral ashes. The cost of the incineration increases rapidly with increasing water content in the sludge, as does the flue gas volume. The fluidized-bed sludge incineration is simple, economical and efficient. (Takacs-FIRL)

**ACTIVATED CARBON TREATMENT OF UNBLEACHED KRAFT EFFLUENT FOR REUSE,**
Saint Regis Paper Co., Pensacola, Fla. Research and Development Center.
E. W. Lang, W. G. Timpe, and R. L. Miller.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 246, $7.50 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/2-75-004, April 1975. 207 p, 30 fig, 41 tab, 52 ref, 10 append. EPA 1BB037, 12040 EJU.

Descriptors: *Water reuse, *Waste water, Treatment, *Activated carbon, Chemical wastes, Biochemical oxygen demand, *Industrial wastes, *Pulp wastes, Cost trends, Pilot plants, Effluents, Calcium carbonate, Tertiary treatment, Lime.
Identifiers: Pulp mill effluents, Color removal, *Unbleached kraft wastewater treatment, Microlime-carbon process, Total organic carbon.

A four-year pilot plant program was carried out to investigate the technical and economic feasibility of treating unbleached kaft pulp and paper mill effluent for reuse. Preliminary laboratory studies and cost estimated indicated that the following treatment sequences should be investigated in the pilot plant: (1) primary clarification, carbon adsorption, (2) lime treatment, carbon adsorption; (3) primary clarification, bio-oxidation, carbon adsorption. Water of reusable quality can be provided from unbleached kraft effluent by several combinations of treatment utilizing activated carbon. Unbleached pulping effluents typically contain about 1000 color units, 250 mg/l TOC, and 250 mg/l BOD. Reusable water quality as defined in this study is 100 color units and 100 mg/l TOC. The most economical treatment is the microlime-carbon process that utilizes low dosages of lime and clarification followed by carbon adsorption in down-flow granular carbon beds. Capital cost for treatment by this process of 9.6 mgd of unbleached kraft effluent from an 800-ton-per-day mill was estimated to be $6.7 million. Operating costs, inclusive of capital depreciation, were estimated to be $0.30 per 1000 gal and $3.58 per pulp-ton, including credit for the reused water. Carbon adsorption in continuous counter-current stirred contactors was found to have promise of lower operating cost and substantially lower capital costs as compared to adsorption in fixed beds. (EPA)

**SOLVENT SOLVES DEWATERING.**
Water and Wastes Engineering, Vol 11, No 9, p 84, September 1974.

Descriptors: *Waste water treatment, *Sludge treatment, *Dewatering, *Separation techniques, *Solvents, Municipal wastes, Industrial wastes, Solubility, Energy, Costs, Washington.
Identifiers: *Seattle(Wash).

A new process using a solvent for dewatering of municipal and industrial sludge has been developed by the Boeing Aerospace Company of Seattle. It is designed to comply with strict water and air pollution control regulations and will allow the reclamation of oil and other sludge constituents. A solvent of the aliphatic amine family which becomes completely miscible below 20C is mixed with the sludge. The resulting solution is a mixture of solid particles in a solution of water, solvent, oils, and fats. Solids are removed mechanically; water and solvent are separated by heating the solution to above 40C; and fats and oils are removed from the solvent by distillation. The solid portion is about 96% solid and will gather moisture in a normal atmosphere; the water is clear and sterile; and the oils and fats are of a commercially reclaimable grade. This technique is called the Boeing Extractive Sludge Treatment (BEST) and works equally well with highly organic or inorganic sludges. A theoretical savings of up to 90% in energy could be realized if BEST is used instead of some of the high temperature evaporation drying systems now used. Engineering cost analyses indicate an overall potential savings of 25% to 50% over present sludge dewatering methods. (Orr-FIRL)

**USING SLUDGE, OIL, AND WATER SEPARATION FOR RECYCLING WATER.**
Water and Sewage Works, Vol 121, No 11, p 41-42, November 1974.

Descriptors: *Waste water treatment, *Separation techniques, *Reclaimed water, *Oily water, *Water reuse, Water treatment, Oil wastes, Sludge, Oil pollution, *Recycling.
Identifiers: Endress+Hauser's Vibratrol, Oil reclamation.

The treatment and recycling of water, including the reclamation of constituents which can be reused, can be a contributing factor in energy supply and is becoming increasingly important. A system has been designed to reclaim oil and sludge constituents. It is the Endress+Hauser's Vibratrol, a submergible vibrating tuning fork level control. It is an automatically-controlled separator system that can be buried in the ground. The influent is collected and solids, oil and retreatable water are separated, reclaimed, totalized and treated continuously. Level control sites are the sludge/water interface, the oil level, the water level and water outflow totalization. The E+H Vibratrol vibrates in air, water, or a similar substance. When the tuning fork is contacted by sludge or solids at a predetermined level, it activates an agitator and pump for reclamation of sand, clay and gravel. The Vibratrol consists of a pair of piezo ceramic crystals mounted permanently within the tuning fork assembly. The piezo-electric principle is applied in a closed loop: power is supplied to a crystal which then oscillates, the oscillation is picked up by the tuning fork, increased to its natural resonant frequency, ending in a sympathetic, harmonic vibration which drives the second crystal to provide power output. **CHEMICALS REDUCE SYSTEM ODOURS,**
Winnipeg Waterworks, Waste, and Disposal Div. (Manitoba).
A. Penman, and W. J. Borlase.
Water and Pollution Control, Vol 113, No 1, p 29, 33, January 1975.

Descriptors: *Odors, *Sewage treatment, Municipal wastes, Industrial wastes, Oil industry, *Canada, Chlorine, Pilot plants, Costs, *Waste water treatment.
Identifiers: *Micro-Aid, Winnipeg(Canada).

The sewage system of the City of Winnipeg, Canada accepts wastes from one major oil refinery and three meat packing plants at one of its lift stations. Upstream from the lift station, the combined industrial and municipal wastes have been causing sewer odors. Treatment of these odors in the past has been by chlorination. However, with increasing chlorine costs, possible difficulties in obtaining chlorine, and danger involved in its storage and use, alternative treatment methods have been investigated. In 1974, a product called Micro-Aid was tested over a seven-week period during the hottest summer months. The product is extracted from Yucca plants and consists of 10% natural saponins extracted from plants, 90% inert water, and 150 ppm of copper as a preservative. Five test sites were sampled for atmospheric temperature, sewage temperature, dissolved sulfide, atmospheric sulfide, pH, and general odor. Three periods of study compared Micro-Aid, chlorine, and no odor control treatment. Overall reduction of odors was found with Micro-Aid but chlorine provided better immediate reduction in atmospheric and dissolved sulfide levels. Micro-Aid does not reduce levels of dissolved sulfide within the sewage, but acts as a surfactant, reducing the surface tension of the sewage and keeping the hydrogen sulfide in solution. A one-year trial of this product for 1975 has been proposed. Although its costs are 25% higher than chlorine, operational and safety benefits may warrant its use. (Prague-FIRL)

**HYDRAULIC MODEL STUDY OF A LARGE-CAPACITY SETTLER IN A WATER CAPTURE SYSTEM (BADANIA HYDRAULICZNE MODELU DUZEGO OSADNIKA NA UJECIU WODOCIAGOWYM),**
W. Petrozolin.
Gaz, Woda i Technika Sanitarna, Vol 48, No 7, p 232-235, 1974.

Descriptors: *Hydraulic models, Flow rates, Efficiencies, Wind, Model studies, *Waste water treatment, *Sewerage.
Identifiers: *Warsaw(Poland), Settlers, Water capture.

Studies were conducted on a hydraulic model of a large capacity settler in the Warsaw sewage system in order to investigate the feasibility of improvements in the old settler built between 1924 and 1928. The scale was 1:25, the length of the model 32 m, the width 13 m, and the depth 12 to 16 cm. The model was installed in conditions similar to actual settlers. The studies were conducted in August, September, and October 1971; June 1972; and November 1972. The parameters studied were: the surface of the water in the settler, the intensity of the flow, division of flow through three openings, the wind, and the existence or absence of partitions impeding or changing flow direction. Wind was the major significant factor. Conclusions were reached by comparing mean velocities in selected partitions of the model with mean theoretical velocities. At maximum velocities from 1.42 m/min to 0.19 m/min, the mean velocities varied from 0.59 to 0.12 m/min, the mean active depths constituted a 23% to 77% of the total depth, and the mean actual velocity was 1.3 to 4.9 times higher than the mean theoretical velocity. The flow time varied from 2 to over 9 hours during various days or times of the day, influencing the maximum velocity and settling of the wastes. The disturbing action of the wind regulated the settler's activity, but efficiency could be increased by only four percent. (Urbanski-FIRL)

**IMENTAL EUTROPHICATION OF TER- IAL AND AQUATIC ECOSYSTEMS. ANNUAL REPORT OF THE UPLAND RGE PROJECT,**
aven National Lab., Upton, N.Y.

G. M. Woodwell, J. Ballard, M. Small, E. V. Pecan, and J. Clinton.
Report BNL 50420 (Biology and Medicine TID-4500), February 1974. 29 p, 17 fig, 11 tab, 12 ref. AEC AT(30-1)-16.

Descriptors: *Model studies, *Waste water treatment, *Tertiary treatment, *Aquatic habitats, *Terrestrial habitats, Groundwater recharge, Nutrient removal, Vegetation, Forests, Agriculture, Waste water disposal, Recycling, Sewage treatment, Nutrients, New York.
Identifiers: Brookhaven(NY).

Alternatives to dumping sewage into coastal oceans are being studied at the Brookhaven National Laboratory, New York. A report on the development of a system of sewage treatment that returns potable water to the water table and recycles the nutrients with the least input of fossil fuel energy is presented. The quality of groundwater varied; the highest quality was associated with undisturbed forest. The greatest variation was in nitrogen and calcium which were high in agricultural fields, low in oil fields and pine forests, and lowest in late successional oak-pine forests. After six months application of sewage, phosphorus and iron were totally absorbed, sulfur and magnesium partially absorbed, potassium and calcium decreasingly absorbed, and sodium and chlorine not absorbed. Nitrate nitrogen in the percolate of oak-pine forests treated with primary effluent rose slowly during September and October, and more rapidly in November and December. In the forest treated with secondary effluent, the nitrate-nitrogen level reached a maximum in November. In aquatic systems, meadows effectively reduced the organic content and reduced the specific conductance of sewage during the winter. A combination of aquatic and terrestrial systems will probably be the most effective treatment method. (Buchanan-Davidson--Wisconsin)

**AN INTEGRATED SYSTEM FOR DISPOSAL OF SLUDGES ORIGINATING FROM WATER SOFTENING AND SEWAGE TREATMENT IN MUNICIPALITIES,**
Kansas Univ., Lawrence. Dept. of Civil Engineering.
J. W. Moore.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 879, $8.50 in paper copy, $2.25 in microfiche. Ph.D. Thesis, 1971. 244 p, 43 fig, 38 tab, 54 ref. OWRT A-031-KAN(3). 14-31-0001-3016.

Descriptors: *Waste water treatment, *Sludge treatment, *Water softening, *Sludge disposal, Economics, Recirculated water, Kansas, Phosphorus, Hydrogen ion concentration, Chemical oxygen demand, Alkalinity, Sewage treatment, *Solid contact processes.

The objective was to explore the feasibility, both technically and economically, of developing an integrated system for the disposal of sludges originating from water softening and sewage treatment in municipalities. The proposed system consists of utilizing the water softening sludge in a beneficial use in the primary treatment process of the sewage treatment plant, then handling the resulting sludge in one disposal operation. A laboratory solids contact unit was constructed and operated on raw wastewater with lime softening sludge added at the rate of 600 milligrams per liter of raw sewage. Provisions were included for the recirculation of the lime softening sludge. The effluent from the solids contact unit was characterized and dewaterability studies were performed on the sludge retained in the unit. Both orthophosphate and total phosphorus concentrations normally present in domestic sewage can be reduced by about 20 per cent for orthophosphate and 30 per cent for total phosphorus by the addition of 600 milligrams of lime softening sludge per liter of raw sewage with continuous mixing. The total phosphorus removal can be increased to about 46 per cent by recirculation of the lime softening sludge. The addition of lime softening sludge with recirculation resulted generally in a pH of 7.8, chemical oxygen demand removal of 65 percent, five-day biochemical oxygen demand removal of 75 per cent and total solids removal of 35 per cent. A pH increase of about 0.4 pH unit and an alkalinity increase of about 50 milligrams per liter were observed. The sludge withdrawn from the primary unit can be expected to be about 3.5 times that resulting from conventional settling but when the total sludge quantities are compared for the overall system, including waste activated sludge and lime softening sludge, the lime softening sludge system results in a total sludge production only slightly larger than in separate systems. The mixture of lime softening sludge and primary sludge filtered well without filtration aids.

**A COMPUTER SIMULATION ANALYSIS OF SURFACE WATER QUALITY MANAGEMENT POLICIES UNDER DYNAMIC ECONOMIC AND HYDROLOGIC CONDITIONS,**
Clemson Univ., S.C. Dept. of Electrical and Computer Engineering.
J. W. Hyden.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 842, $9.25 in paper copy, $2.25 in microfiche. Ph.D. Dissertation, August 1973. 294 p, 16 fig, 9 tab, 69 ref, 14 append. OWRT B-030-SC(5).

Descriptors: *Water quality standards, *Economics, *Management, Surface waters, *Simulation analysis, Computer models, Water policy, *Waste water treatment, *Optimization, Model studies, *Computer programs.

The general purpose of this research is to determine the optimal economic wastewater treatment levels for individual users in a river basin. The specific case used in this study consists of a series of firms located along a river, such as municipalities, wet process industries, or recreational facilities, which have the river as their only source of raw water supply, and as the ultimate discharge point of their wastewater. The economically optimal wastewater treatment assignment levels are defined as the minimization of the sum of costs imposed on the individual users for wastewater treatment and of those resulting from damages caused by waste discharges of the upstream users. It is shown mathematically that the optimum occurs when, for all users, the marginal treatment cost equals the sum of the respective downstream marginal damage costs. Analyses of the effectiveness of a given water quality management policy in maintaining reasonable economic efficiency as various conditions change are presented in a prototype, computer simulation program, in order to consider such an approach in river basin planning activities.

**USE OF LIME-SODA ASH SOFTENING SLUDGE FOR THE TREATMENT OF MUNICIPAL WASTEWATER,**
Kansas Univ., Lawrence. Dept. of Civil Engineering.
W. E. Johnson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 913, $2.25 in microfiche. M.S. Thesis, (1971). 47 p, 6 fig, 14 tab, 17 ref. OWRT Project A-031-KAN(2). 14-31-0001-3016.

Descriptors: *Kansas, Waste water treatment, *Sludge treatment, *Water softening, *Sludge disposal, Sedimentation, Recirculated water, Phosphorus, Hydrogen ion concentration, Lime, *Municipal wastes, Waste disposal.
Identifiers: Jar tests, *Lime-soda ash process, Lawrence(Kan).

Research was conducted on the characterization of the sludge produced by a lime-soda ash water softening process and the possible utilization of the lime sludge for precipitation of phosphorus and other pollutants from Lawrence wastewater. The lime sludge consisted of calcium carbonate (85%), magnesium hydroxide (4%), and volatile suspended solids (6%); 2.6 pounds of lime sludge was produced per pound of lime added to the water being treated in the softening process. About 400 to 600 mg of lime sludge per liter of wastewater could be added. This amount of lime sludge raises the pH about 0.5 of a pH unit which is not near the anticipated pH of 9.5. At a pH of 9.5 there is good phosphorus removal and additional BOD and COD removal. Jar tests with lime sludge and additional lime to raise the pH to 9.5 showed that lime sludge tends to resist a change in pH. Phosphorus removal from wastewater would not be significant on a continuous run basis with the amount of sludge produced by the Lawrence water treatment plant.

**LABORATORY SIMULATION OF SWINE MANURE LAGOONS,**
Clemson Univ., S.C. Dept. of Agricultural Engineering.
C. L. Barth.
Available from the National Technical Information Service , Springfield, Va. 22161 as PB-243 888, $3.25 in paper copy, $2.25 in microfiche. Presented at 70th Annual Meeting of the Association of Southern Agricultural Workers, Incorporated, February, 1973, Atlanta, Georgia. 9 p, 6 fig, 5 tab, 11 ref. OWRT A-025-SC(1).

Descriptors: *Farm lagoons, *Physical properties, *Chemical properties, *Anaerobic digestion, Lagoons, Temperature, Biodegradation, Southeast U.S., *Design criteria, Load distribution, Hogs, *Waste treatment.
Identifiers: Detention time, Volatile-solids-reduction, *Laboratory simulation, Load rates.

Anaerobic lagooning of swine manure waste is widely used and is considered successful in the Southern Region of the United States. Evaluation of the variation in design standards employed by individual states in the region indicates that much uncertainty exists in the application of present knowledge and design values. A progress report is presented on a study of anerobic lagooning properties of swine waste. Findings indicate the effect of loading rate and temperature in lagoon operation. This research provides basic knowledge on lagoon operation under conditions prevalent in the Southern Region and contributes to more uniformly applied design criteria.

**BIOLOGICAL WASTEWATER TREATMENT MODEL BUILDING FITS AND MISFITS,**
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
W. C. Boyle, and P. M. Berthouex.
Biotechnology and Bioengineering, Vol 16, No 9, 1139-1150, 1974. 6 fig, 3 tab, 43 ref.

Descriptors: *Biological treatment, *Waste water treatment, Statistics, *Model studies, Data collections, Treatment facilities, Design criteria, Operations, *Statistical models.
Identifiers: Model parameter estimation, Model discrimination.

During the past decade, statisticians have attempted to develop a uniform biological waste water treatment model which would aid in the design and operation of treatment facilities. A discussion of the validity of a single model is presented, including statistical problems in model parameter estimation and model discrimination. The physical process of fitting models usually precedes model building but parameter estimation processes are often overemphasized. Examples were given to illustrate that a model cannot be accepted simply because it fits the data. Goodness of fit is a necessary but not sufficient condition for acceptance of any model. When two or more conflicting models fit the data, it is necessary to give each model a chance to fail in order to verify a proposed model. (Prague-FIRL)

**MODELING MICROBIAL GROWTH IN WASTEWATER TREATMENT,**
Royal Inst. of Tech., Stockholm (Sweden). Dept. of Water Chemistry.
B. Hultman.
Journal Water Pollution Control Federation, Vol 47, No 4, p 843-850, April, 1975. 4 fig, 4 tab, 10 ref.

Descriptors: *Bacteria, *Biological Treatment, *Model studies, *Waste water treatment, Equations, Activated sludge, *Microbial degradation, Growth rates.
Identifiers: *Bacterial growth.

A model for bacterial growth was developed in order to choose suitable reactors for biological treatment of waste water. The growth equations for bacteria were divided into formation rate of living bacteria; formation rate of nonviable bacteria; utilization rate of substances necessary for cell synthesis; utilization rate of the energy source; utilization rate of the electron acceptor; and formation rate of a product. Bacteria may grow in suspensions, such as in the activated sludge process or anaerobic digesters, on inert contacting material such as trickling filters, rotating disks, contact aerators, or inert suspended solids, and on adsorbing materials such as activated carbon. Rate constants were determined using stocihiometric and thermodynamic theories. The most common method for the biological treatment of waste waters in Sweden, is the activated sludge process, where bacteria grow in suspension. However, in some process combinations including postprecipitation or biological nitrogen reduction, bacterial growth on inert or adsorbing contact materials may be superior to that in suspended growth reactors. (Prague-FIRL)

**NEEDED: $350 BILLION - AND A NEW NEEDS SURVEY,**
A. S. Heid.
Journal Water Pollution Control Federation, Vol 46, No 10, p 2254-2257, October 1974. 1 tab.

Descriptors: *Federal Water Pollution Control Act, *Water pollution control, *Pollution abatement, *Costs, *Construction, Facilities, Storm water, *Sewage treatment, Tertiary treatment, Sewers, Governments, Legislation, Governments supports, Financing, *Waste water treatment, Surveys.

State agencies have now estimated that to meet the 1983 goals of the Federal Water Pollution Control Act Amendments of 1972, they would require $350 billion. Money needed for treatment and control of storm water, a category not previously included, totals $235 billion. Omitting this category, the states' estimated needs for 1974 are $55 billion more than the $60 billion reported in the 1973 survey. The 1974 survey was ordered by Congress to provide information on states' estimated needs to form a basis for the consideration of a new authorization for granting construction funds and for future allocations to the states. The cost estimates of the 1973 survey represented only a first step in the necessary assessment of construction costs. However, as reported by R. Train, EPA administrator, the EPA preliminary analysis exaggerates the costs of meeting the requirements of PL 92-500; there are less expensive methods of abating storm water pollution than those figured in the costs. In addition, the EPA considers following categories the important areas for granting construction funds: Category I-costs necessary to achieve the required level of secondary treatment; Category II-costs necessary to achieve more stringent levels of treatment than secondary treatment for cases in which advanced treatment is implicit for meeting established standards for water quality; and, Category IVb-costs for new interceptor sewers. **DESIGN OF SURFACE WATER OUTFALLS TO RIVERS,**
Lothians River Purification Board (Scotland).
G. S. Hamilton, and G. A. Haig.
Surveyor, Vol 145, No 4313, p 48-49, February 7, 1975. 1 fig.

Descriptors: Surface waters, Rivers, Discharge(Water), *Design criteria, Drainage engineering, Hydrological aspects, Flood control, Outlets, *Outfall sewers, *Outlet works, *Sewers.

A design for a simple outfall arrangement from surface water drainage systems to a river is illustrated. The Lothians River Purification Board, Great Britain, has adopted engineering guidelines for discharging to rivers. Principles to be followed include protection of the river bed from scour, compatibility with the hydrological characteristics of the river, protection of the banks of the river, and access availability for inspection and maintenance. Once the outfall velocity has been selected, the energy of the water is dissipated and scour is resisted by the construction of energy dissipators in the form of steps, by angular outflow to the river (generally 60 degrees to the river flow), and by protection of the river bed by a gabion mattress. For all outfall design calculations, the engineer must consider the hydrological regime of a specific river to determine flood frequency curve in terms of river stage at the outfall point, so as to protect the surface water system in flood conditions. The banks of rivers are protected by wing walls with stable bank protection behind the walls; access to the outfall should be provided in the form of steps for sampling and maintenance purposes. Petroleum pipelines, Gas lines.

Various methods are presented of laying and designing pipelines for water supply, heat supply, and sewerage, in addition to trunk petroleum and gas lines in permafrost conditions. General information is presented on engineering utility and sewage lines in permafrost soil. The construction of sanitary engineering utility and sewage lines and trunk pipelines, is described. A collection of initial data is presented for calculating structures. Thermal calculations such as heat losses of pipelines, underground conduits, temperature of liquids in pipelines, and amount of insulation are discussed. The calculation of supports and foundations of engineering utility and sewage lines is outlined. Procedures for the thermal calculation of pipelines and for supports and footings of engineering utility and sewage lines in various permafrost soil conditions are set forth. The calculation theory is illustrated with examples from current design practice. (Orr-FIRL)

Descriptors: *Treatment facilities, *Waste water treatment, *District of Columbia, Design criteria, Control, Computers, *Tertiary treatment, Planning, Pilot plants.
Identifiers: Blue Plains Water Pollution Control Facility.

The District of Columbia's Blue Plains Water Pollution Control Facility has been studied since 1968. Key process steps to improve the plant have been underway since 1971. Design steps have been implemented concurrently with confirmatory tests at the EPA-DC Pilot Plant on D.C. waste water. Methods which were analyzed included: nitrogen removal by the biological nitrification-denitrification process, consisting of nitrification and denitrification reactors and sedimentation basins; phosphorus removal by the addition of alum and/or ferric chloride to both the secondary modified aeration system and the denitrification system; sludge processing by gravity thickening of primary and storm water sludges; and flotation thickening of secondary and advanced treatment sludges, followed by vacuum filtration and incineration. The advanced waste water treatment facilities were designed for operation in two halves to permit comparative tests while operating at different MLSS concentrations, chemical dosages, and other variables. When the treatment plant is completed, it will contain four computer systems, three for process control and one for data processing. The processes to be controlled by these systems are return sludge, waste sludge, chemical treatment (lime, ferric chloride or alum, methanol, and polymer), and pumping. Using the D.C. concurrent design and pilot plant testing has saved two years of time, and the plant to be built will be the largest of its type. (Prague-FIRL)

**OPERATION OF FULL-SCALE BIOLOGICAL PHOSPHORUS REMOVAL PLANT,**
Biospherics, Inc., Rockville, Md.
G. V. Levin, G. J. Topol, and A. G. Tarnay.
Journal Water Pollution Control Federation, Vol 47, No 3, p 577-590, March, 1975. 5 fig, 10 tab, 12 ref.

Descriptors: *Nutrient removal, *Phosphorus, Biological treatment, Treatment facilities, *New York, Monitoring, Activated sludge, Microorganisms, Precipitation(Chemical), *Waste water treatment, Aeration, Operating costs.
Identifiers: *Phosphorus removal, *Phostrip, Seneca Falls(NY).

The first full-scale installation of the Phostrip process of phosphorus removal from waste water, marketed by Union Carbide, is in operation at Seneca Falls, New York. The first thirty days of operation were closely monitored, then this biological process was installed on a permanent basis. The method is based on the use of activated sludge microorganisms to transfer phosphorus from inflowing waste water to a small concentration substream for precipitation. The activated sludge is subjected to anaerobiosis, inducing phosphorus release into the substream and providing phosphorus uptake capacity when the sludge is returned to the aeration basin. Total phosphorus effluents as low as 0.2 mg/liter were obtained in full scale plant operation, a level far below the New York State effluent limit of 1.0 mg/liter. Total costs of phosphorus removal, particularly operating costs, were drastically reduced, as compared to conventional methods. (Prague-FIRL)

**DISPOSAL OF WASTE ALUM SLUDGE FROM WATER TREATMENT PLANTS,**
Malcolm Pirnie, Inc., Paramus, N.J.
R. M. Gruninger.
Journal Water Pollution Control Federation, Vol 47, No 3, p 543-552, March, 1975. 3 fig, 5 tab, 4 ref.

Descriptors: *Alum, *Water treatment, *Waste water treatment, *New York, Dewatering, Waste disposal, Land management, Filtration, Separation techniques.
Identifiers: Gravity thickening, Landfill disposal.

The Environmental Protection Agency has classified alum sludge from water treatment plants as an industrial waste which may no longer be discharged to streams. Treatment plants in western New York State have been constructed and are operating plant scale alum sludge treatment units; four such alum sludge dewatering facilities are discussed. Characteristics of the sludges were affected by the substances used in water treatment and may be highly variable. No single system can economically dewater dilute alum sludge to the minimum acceptable concentration for landfill disposal. An investigation of alternatives indicated that the separation of the solids from alum sludge is best accomplished in a two stage system. The first step should be primary thickening by gravity to achieve a solids concentration of two to six percent total solids by weight. The second stage is mechanical dewatering, achieved through pressure filters, vacuum filters, or scroll centrifuges, obtaining a solids concentration of at least 20 percent total solids by weight. **REMOVAL OF ORGANIC MATTER BY ACTIVATED CARBON COLUMNS,**
Illinois Univ., Urbana. Dept. of Civil Engineering.
F. B. DeWalle, and E. S. K. Chian.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 100, No EE5, p 1089-1104, October, 1974. 6 fig, 2 tab, 32 ref.

Descriptors: Activated carbon, *Activated sludge, Effluents, Sewage treatment, *Organic matter, Adsorption, *Waste water treatment, Tertiary treatment.
Identifiers: Molecular weight, *Activated carbon columns. TOC.

Activated carbon treatment is conventionally used as a tertiary unit process following activated sludge treatment. However, it has been suggested that there is significant leakage of organic matter through the columns and that activated sludge treatment adversely affects the removal of organic matter in activated carbon columns. An evaluation of the effect of activated sludge treatment on the composition of organics in the effluent and this effect on subsequent activated carbon treatment was conducted. The composition of the organic matter

in secondary effluent was studied as was the removal of these compounds in activated carbon columns. The major organic fraction adsorbed in activated carbon columns is a fulvic acid-like material with a molecular weight of 100 to 10,000. These compounds adsorb very well in activated carbon columns. Since they also represent a major fraction of the organic matter, adsorption in activated carbon columns was expected to increase with increasing degradation of the waste water. This phenomenon did occur in a study in which the TOC removal of a filtered mixed liquor by activated carbon increased in the succeding compartments of a plug-flow activated sludge unit. **SECONDARY TREATMENT DESIGN FOR COMBINED WASTEWATERS, PART II,**
C. N. Smith.
Water and Sewage Works, Vol 122, No 4, p 82-84, April, 1975. 1 fig.

Descriptors: *Sewage treatment, *Design, *Waste water treatment, *Industrial wastes, Municipal wastes, Canneries, Tannery wastes, Aeration, Chlorination, Dewatering, Sludge, Effluents, Water pollution control, Treatment facilities, Filtration, Disinfection, Maine.
Identifiers: South Paris(Maine), Clarification, Carbonation, Chromium removal, Sulfide removal, Pretreatment(Waste water).

A unique Water Pollution Control Facility is being constructed at South Paris, Maine, for the joint treatment of wastes from the town, a cannery and a tannery. The project is scheduled for completion in the spring, 1975; the total cost is $6,800,000 of which $4,500,000 is the facility construction cost. A detailed outline of the treatment scheme is presented. The system includes: pretreatment of the combined cannery and municipal effluents; pretreatment of the beam house wastes and tan house wastes; primary clarification; aeration; carbonation; secondary clarification; and chlorination. The tannery effluents are treated by filtering through rotating drum screens, equalization, clarification, carbonation, and upflow clarification before being mixed with the pretreated municipal and cannery sludge in the aeration tanks. Two systems of sludge dewatering are provided, one for the sludge from the carbonation stage and one for the sludge from the secondary clarifier. The treatment will provide for 90 percent chromium removal, 100 percent sulfide removal, and 99 percent disinfection. (Orr-FIRL)

**CLEANING OF PETROLEUM-INDUSTRY EFFLUENT,**
V. P. Tronov, R. G. Nurutdinov, and A. D. Li.
Soviet Patent SU432106. Issued June 23, 1971.
Soviet Inventions Illustrated, Vol W, No 17, p 2, June, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, Oil industry, *Effluents, Emulsions, *Patents, Cleaning, *Oil pollution, Oil wastes.
Identifiers: Drainage tanks, Buffer tank.

A treatment method for a petroleum processing waste water stream is described. The petroleum is diluted by a stratum flooding system in an amount corresponding to a ratio of 0.4 between the total water flow and the emulsion flow. The water leaving the plant (98-99 percent) is sent into a feedstock line about one km from a preliminary tank. The retention time in the feedstock line is 15-21 minutes. An emulsion containing 10-12 percent water passes from the preliminary drainage tank to the next stage. The settled water from the preliminary drainage tank is sent to a buffer tank where it is kept for 1.5-2.0 hours before being pumped into the stratum flooding system for use as dilution water. If the starting emulsion contains less than 30 percent water, then the required phase ratio can be maintained by preliminary accumulation or addition from another source. (Orr-FIRL)

**DYNAMIC LEACHING STUDIES ON PULPWOOD BARK RESIDUES,**
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
A. H. Benedick, J. J. McKeown, and R. D. Hart.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 100, No EE4, Paper No 10701, p 869-882, August 1974. 15 fig, 3 tab, 1 equ, 1 ref.

Descriptors: *Water pollution control, Pulp and paper industry, *Leaching, *Sewage treatment, *Solid wastes, *Bark, Disposal, Operations, Effects, Biochemical oxygen demand, Industrial wastes, Water quality, Chemical oxygen demand, *Pulp wastes, *Waste water treatment.
Identifiers: Receiving waters, BODS.

Recent years have witnessed a growing concern by the pulp industry over the effect of bark disposal operations on receiving water quality. In these circumstances, the National Council of the Paper Industry for Air and Stream Improvement, Inc., undertook a laboratory study to define the quantities of BOD5, COD, and color leached from fresh and field-aged pulpwood bark residues under several experimental conditions. Barks from northeastern species were used in all investigations. Results showed that the quantity of BOD5, COD, and color leached from bark residues under dynamic leaching conditions depends on the field-storage age of the bark and on the conditions under which leaching occurs. Working curves for estimating BOD5, COD, and color contributions from northeastern pulpwood bark residues are presented. (Bell-Cornell)

**AUSTRIAN PLANT KNOCKS OUT NITROGEN,**
Technische Hochschule, Vienna (Austria). Institut fuer Wasserversorgung Abwasser reiningung und Gewasserschuts.
N. F. Matsche, and G. Spatzierer.
Water and Wastes Engineering, Vol 12, No 1, p 18-24, January, 1975. 9 fig, 2 tab.

Descriptors: *Treatment facilities, *Aeration, Effluents, Sludge treatment, Construction costs, Sewage treatment, Design criteria, Nitrogen, *Waste water treatment, Nitrification, *Denitrification.
Identifiers: *Vienna(Austria), *Nitrogen removal.

The Vienna-Blumental treatment plant in Vienna, Austria uses aeration with mammoth rotors, alternately with oxic and anoxic zones in the cycling mixed liquor, to accomplish nitrification and denitrification. With experiments using differing numbers of rotors, nitrogen removal level reached up to 85%. The plant has a pumping tion, screens, an aerated grit chamber, two a tion tanks, two final sedimentation tanks, a return sludge pumping station. Waste wate lifted by screw pumps; coarse material is remo by bar screens; sand and floatable materials removed in the grit chamber. Waste water fl directly to the aeration tanks. Mixed liquo clarified in two final sedimentation tanks. Effl flows directly to the receiving stream and return sludge is pumped back with a constant to enter the aeration tank with the raw w water. Excess sludge is removed from the re sludge by pumping it to the Liesingtal sewer t treated at Vienna's main sewage treatment p Evaluations of construction costs, design c and efficiency of the operation have been s since 1971. In 1974, different numbers of operi rotors were tested. Removal of excess sludge held constant. Pollutant loading varies when dustries discharge waste water into the sys Three plus three rotors is the normal op number for year round operation. NH4-N determined in laboratory tests; organic nitr was estimated as well. (Prague-FIRL)

udges from water purification formerly dried in beds with a depth of 20 cm ey were then manually removed. For automatic sludge removal equipment, rs are more suitable. For determination ct of the thicker layer on the drying periments were carried out: in 4 by 8 m s with concrete bases and drainage by 8 beds with cobbled bases and oes; and in 4 by 8 m beds with gravel r a period of several years, the in-he sludge layer (20, 30, or 40 cm), the se (concrete, cobbled pavement, or the origin of the sludge (mechanical or biological waste water treatment) was er natural conditions. Sludges dried on e base had a relatively pasty bottom the top and center did not differ much in sludges dried on gravel bases. For eaning of sludge drying areas, a layer of 40 cm was found to be best. The ss was impaired by the concrete base, with sludges from activated sludge ations. (Nave-FIRL)

NT INVESTIGATIONS INTO PAR-REATMENT SYSTEMS AT MAC-

eton, and T. H. Kirby.
ion Control, Vol 73, No 5, p 521-531, tab, 6 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Pre-treatment, Activated sludge, Filtration, *Pilot plants, Sewage treatment, Costs, Construction materials, Filters.
Identifiers: High rate biological treatment, Macclesfield(Great Britain).

Continued growth of the population in the drainage area coupled with the expansion of a pharmaceutical factory led to demand for additional capacity at the treatment works at Macclesfield, Great Britain. A biological treatment plant had been installed between 1961 and 1964. Experimental work on biological filtration was carried out between 1966 and 1969. In 1970, a second program was tested to assess the effectiveness of partial pretreatment of settled sewage for the reduction of BOD before its discharge onto biological filters. Two partial pre-treatment systems were examined: a high-rate activated sludge system using surface aeration; and a high-rate biological filtration using plastics filter media, each with a pilot plant. Comparisons of costs and efficiencies are given. It was concluded that a pilot plant is far more difficult to operate effectively than a full sized sewage works. Additionally, while a high rate activated sludge unit requires only the existing filter beds to be retained for secondary biological filtration, a high rate filtration unit needs the addition of extensive supplementary low rate biological filters. **LIQUID FILTER APPARATUS,**
Hydromation Filter Co., Livonia, Mich. (assignee)
G. Hirs.
United States Patent 3,814,688. Issued June 4, 1974. Official Gazette of the United States Patent Office, Vol 923, No 1, p 264-265, June, 1974. 1 fig.

Descriptors: *Patents, *Water pollution treatment, Equipment, *Filters, Filtration, *Waste water treatment.
Identifiers: Liquid filter apparatus.

A liquid filtering device is described. The polluting liquid is introduced between opposed, planar, horizontal filter media. It then flows simultaneously through the opposed media to accrete the pollutants on the confronting faces of the media. The media are cleaned by interrupting the pollutant liquid flow and backwashing the upper filter media. Removable filter media can be discarded between the medial and lower chambers. This disposable filter is supported on a continuous conveyor and the medial and lower chambers may be separated to remove the disposable filter medium and the pollutants collected on both filter media. **A CONCEPT FOR MANAGING WASTE,**
Gulf Waste Disposal Authority, Houston, Tex.
J. P. Teller.
Chemtech, p 222-224, April 1975. 3 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Municipal wastes, Oil industry, Treatment, *Cost allocation, Texas, Organic compounds, Organic wastes, *Waste disposal, *Oil pollution.
Identifiers: Petrochemical plants, Gulf Coast Waste Disposal Authority, *Combined treatment.

The practical business aspects of a combined treatment system for wastes from several petroleum and petrochemical plants in the Houston, Texas, area are discussed. The Gulf Coast Waste Disposal Authority was organized in 1969 to dispose of industrial and municipal wastes. The Authority's first action was to convince five major companies, Champion International, Atlantic Richfield, Crown Central Petroleum, Petro-Tex Chemical, and Air Products and Chemical, to sign binding agreements to finance the 55 mgd Washburn Tunnel Facility. A treatability study was first performed which determined that the wastes were amenable to combined treatment. The next phase was the establishment of the initial costs and percentage involvement of each company and signing of contracts. Some of the main points of the contracts include: an Industrial Advisory Council; the right of the companies to take over operation of the plant if the Authority is unable to continue operation; arbitration in case of contract administration disputes; and, a specified method for payment of (if any) levied fines. The advantages of the joint approach include the following: tax-free capital investment; ad-valorem tax exemptions; sales-tax free purchases by the Authority; chemical costs savings through the balancing effects of the various combined wastes; and elimination of multiple laboratory facilities. (Orr-FIRL)

**DESIGN FOR SOLVENT RECOVERY,**
Chem-Pro Equipment Corp., Fairfield, N.J.
J. W. Drew.
Chemical Engineering Progress, Vol 71, No 2, p 92-99, February 1975. 11 fig, 6 tab, 4 ref.

Descriptors: *Reviews, *Costs, *Design criteria, Water pollution control, Phenols, Solvents, Water reuse, Recycling.
Identifiers: *Waste reuse, *Solvent recovery.

A review is given of the necessary steps to establish a system of reusing solvents from exhaust air and waste water in terms of costs, shortages, and pollution problems. Recovery involves removal of the solvent or collection of a liquid solvent contaminated with chemicals, dirt, and other solvents. The collected solvent must be purified, usually by distillation, and sometimes additionally by extraction. Flowsheets illustrate alternative recovery processes. While direct distillation of solvents from waste waters is possible, it is often more economical to do preliminary extraction with a water-immiscible solvent and then separation from the solvent by distillation. Commercial applications of this method are the removal of traces of phenol from waste water and the recovery of acetic acid from dilute aqueous solutions. The economic specifications for recovered solvents are: water content of the solvent, 0.05-0.50%; cross mixing of solvents, 0.5-5.0%; and organic content of the waste water, 10 to 100 ppm. Design optimization for a test system has been computed. Costs for any application are correlated with size, material of construction, and increases due to inflation. Safety and experience factors should also be included among design criteria. (Prague-FIRL)

**WASTE-HEAT STEAM RUNS EVAPORATIVE WATER PURIFIER.**
Chemical Engineering, Vol 82, No 6, p 34, March 17, 1975. 1 fig.

Descriptors: *Waste water treatment, Sewage, Industrial wastes, Oils, Chemicals, *Water purification, Desalination, Evaporation.
Identifiers: *Waste heat, Steam, Water purifiers.

An advanced method of waste water treatment has been developed by the Aluminum Company of America. Called the Alcoa Thermopure Process, this method uses waste heat and is related to previous environmental work in desalination. Low-pressure steam (5-10 psi) is generated by waste heat from various sources, such as furnace stacks. Wastes are concentrated by this process and can be recycled to recover chemicals and oils. Full-scale plant tests have used waste heat to treat effluent from a rolling mill. Earlier bench-scale and pilot plant tests showed that the process is effective for concentration of pollutants from sewage, suspended or emulsified oils, cooling towers, and chemical cleaning solutions. The basin unit operation employed is evaporation. Waste is pumped into the top of a vessel and dispersed by pres-

surized air; the mixture of air and waste water is then heated by hot air and water vapor. Steam introduced into the lower part of the vessel supplies the heat. Humidified air separates the concentrated liquid wastes and is conducted up to bypass line to tube exteriors in the upper part of the vessel. Air cools while it heats incoming waste water-air mixtures. Vapor condenses simultaneously to deionized-quality water. The concentrated liquid is discharged to a tank where wastes can be mechanically separated; if recycling is to be used, mixed wastes are then recirculated. (Prague-FIRL)

**OZONE TECHNOLOGY GAINS SUPPORT.**
Canadian Chemical Processing, Vol 59, No 1, p 19-22, January 1975. 2 fig.

Descriptors: *Ozone, *Canada, *Water purification, *Potable water, Industrial wastes, Pulp and paper industry, Oil wastes, Municipal water, Reviews, Chlorine, Odors.
Identifiers: Montreal, Toronto, Quebec.

A state-of-the-art summary is given for current ozone uses and technology in Canada. Both Metro Toronto and Metro Montreal are installing large ozone plants for municipal water treatment. Montreal is building the world's largest ozone potable water treatment facility, while Toronto is installing ozone units for sewage treatment at two stations to eliminate odors. Most suppliers of ozonators to Canada are now from France and the United States; these corporations are discussed. Canadian industrial applications of ozone include its use in successfully removing phenol from petroleum refinery waste water and its use in treating kraft mill effluents in the paper industry. For such technology, the greatest expenditure is in ozonation equipment. Ozone generator outputs vary and costs are related to power consumption. Advantages of ozone both for industrial water treatment and for potable water are discussed. Chlorine is more prevalent in North America, while ozone is used widely in Europe. Specific water purification systems with ozone are cited in Long Island, New York, Indiantown, Florida, and Paris, France, and are compared with Canadian cities. (Prague-FIRL)

**POLLUTION LAB PAYS OFF--TWO WAYS.**
World Ports, Vol 37, No 4, p 20-21, March 1975.

Descriptors: *Oil pollution, *Industrial wastes, *Combined wastes, *Oil spills, *Monitoring, Water pollution control, Oregon, Waste water treatment, Pollutant identification.
Identifiers: Ballast wastes, Oil skimmers, Portland(Ore).

The operation of an oily ballast disposal plant at the Swan Island Ship Repair Yard, Portland, Oregon, is monitored so that waste water may be properly treated and then discharged to the municipal sewer system. Incoming material is checked for emulsification, to be sure that water is not chemically emulsified; for pH level, which must be corrected to be within the range 5.5 to 9.0; and for salt water content, which must be below 10,000 ppm. These criteria ensure that the ballast wastes will not kill the bacteria used in the sewage treatment system. Incoming waste water originates mainly from ships in drydock, where oil may have seeped into the bilge or where salt water may have been taken on as ballast while at sea. This water is treated in a separator where oil is skimmed off and remaining water is then tested. Water of an acceptable quality is dumped into the sewer system. The oil is sold for use in road work and rerefinement. Protection against oil spills is provided by two oil skimmers at the shipyard. (Prague-FIRL)

**APPLICATIONS OF TOXICITY TESTING TO SEWAGE-TREATMENT PROCESSES,**
Trent River Authority (England).
M. B. Green, D. G. Willetts, M. Bennett, R. F. Crowther, and J. Bourton.
Water Pollution Control, Vol 74, No 1, p 40-58, 1975. 13 fig, 8 tab, 15 ref.

Descriptors: *Biological treatment, *Sewage treatment, Toxicity, Laboratory investigation, Invertebrates, Water quality control, Effluents, Aerobic treatment, *Waste water treatment, *Pollutant identification.
Identifiers: Enchytraeid worms, Screening, *Toxicity tests.

Certain compounds present in industrial effluents are known to disrupt some of the biological stages of sewage treatment. Routine biological inspection of filters in the Upper Tame Main Drainage Authority area of Trent, Great Britain, indicated that filters at certain sewage treatment works had sparse populations of grazing invertebrates. The toxicity of sewage to macro invertebrates such as the enchytraeid worm Lumbricillus rivalis was tested. Applications of toxicity testing involve: measurement of compounds which are known to be deleterious to some extent and which are a usual feature of industrial effluent control, such as heavy metals in both aerobic and anaerobic treatment; industrial waste waters which are not readily controlled by limits determined by conventional analyses; and screening of newly-marketed formulations which might be present in sewage. Laboratory-scale activated sludge units and respirometric techniques were described. It was concluded that the application of toxicity testing to sewage treatment is a valuable method of re-assessing industrial effluent charges and of evaluating acceptable concentrations of certain wastes. Simple screening-test facilities are also useful to check and monitor problems concerning materials being discharged to a sewer. The techniques described are appropriate to the scale of sensitivity required for sewage treatment quality; for discharge of final effluent on watercourses, a higher level of sensitivity would be needed. (Prague-FIRL)

**COMPUTER CONTROL OF SEWAGE WORKS, PROGRESS AT NORWICH,**
C. E. Jones, and P. Cotton.
Public Health Engineer, No 14, p 46-51, March 1975. 1 fig, 7 ref.

Descriptors: *Computers, *Waste water treatment, *Sewage treatment, *Automation, *Pumps, Personnel, Monitoring, *Digital computers, Treatment facilities.
Identifiers: Central Processer Unit.

The progress of a sewage treatment system using a Kent K.70 Central Processer Unit, including a Digital Equipment PDP8E mini computer is discussed. The computer, working at Norwich, Great Britain, has executive control over 60 operating sequences known as control loops as well as 30 subsequences to these loops. Operator control panels and a control setting panel provide communication with the computer. The programs were simulated and site tested, and personnel were given special training in computer technology. The operation in its initial stages has been evaluated and it was found that programming difficulties and faults are minor. An authoritative glossary of sewage treatment terms should be produced to aid communication between various aspects of the control projects. The computer has gone on line; neither the C.P.U. nor the program have had m problems, and only five days were required t plement 30 percent of the programs. The com can monitor the duration of storm overfl operation of stand-by screen, operation of tegrator pumps, starting and stopping low pre effluent pump supplying screen, wash-water sumps, chemical storage tanks, and the oper of the standby detritor. Additionally, it can s the main pumping for operating pumps, s valves, selecting pump duty, and can keep rate records. The system can automatically a certain items such as opening of control valve speed of pumps more efficiently than by manual system. Concern was expressed number of hours of computer down time per hours; improvements have made the system reliable. (Prague-FIRL)

NSIONLESS DESIGN EQUATION FOR E LAGOONS,
xico Univ., Albuquerque.
sen.
from University Microfilms, Inc., Ann ichigan 48106, Order No 75-5900. PhD 974, 337 p.

rs: *Sewage lagoons, *Waste water , *Equations, Lagoons, *Sewage treatment, Biochemical oxygen demand, Climatic data, Statistical analysis, Regression analysis, Model studies, *Design criteria, Computer programs, Computer models.
Identifiers: *Dimensionless equations.

A lagoon design equation was developed based on loading and climatic factors. This dimensionless equation for surface area was based on the results of a one year study of a sewage lagoon. The year was divided into 296 sample periods; for each period data were collected on the chemical, biochemical, and climatic factors associated with the lagoon including biochemical oxygen demand, solar radiation, and wind speed. Stepwise regression analysis was used to determine predictive variables; after regression, the dimensionless products were seen as follows: MOT Number equals SURFACE AREA (SOLAR RADIATION) to the 1/3 power/INFLUENT FLOW RATE (INFLUENT BOD) to the 1/3 power; RED Number equals INFLUENT BOD minus EFFLUENT BOD/INFLUENT BOD; TTC Number equals WIND SPEED (INFLUENT BOD) to the 1/3 power/(SOLAR RADIATION) to the 1/3 power; TEMPR Number equals LAGOON LIQUID Temperature/AIR TEMPERATURE; and DRY Number equals RELATIVE HUMIDITY. The model design selected by a computer program for the estimation of non-linear parameters was: MOT = (2.47 to the RED power + 2.47 to the TTC power + 24.9/TEMPR + 150.0/DRY X 1,000,000. This equation is thus used to calculate the lagoon surface area needed to accomplish any desired BOD reduction (RED Number) given climatic data for the geographical area of a specific lagoon location. **CALIFORNIA PLANT GETS STRAIGHT 'A'S IN COMPUTER CONTROL,**
San Jose-Santa Clara Water Pollution Control Plant, San Jose, Calif.
F. M. Belick, and F. N. Van Kirk.
Water and Wastes Engineering, Vol 12, No 3, p 20-24, 76-77, March, 1975.

Descriptors: *Computers, *Water pollution control, *California, Engineering design, Installation, *Waste water treatment, Monitoring, Flow data, Analog computers, Personnel, *Control systems, Treatment facilities.
Identifiers: *Direct digital control(DDC), San Jose/Santa Clara(Calif).

The San Jose/Santa Clara, California, water pollution control plant has been converted from Pneumatic analog control to direct digital control (DDC) with very little difficulty. Design and installation increased the plant capacity from 94 mgd to 160 mgd. Benefits of the DDC system include treatment efficiency, whereby process flow data is fed to the computer and updated every few seconds, achieving clean effluent discharge and flow balances within each unit process, and plant productivity, whereby most DDC control operations are in a central computer room and a larger(160 mgd) plant may be operated with no significant increase in personnel. Additionally, energy is conserved because automatic control of demand for air eliminates provision of excess air, as under a manual control system. Because the computer monitors loading rate of each tank and whether or not a particular one is in use, the flow of chemicals takes place only when they are needed, conserving the amount of chemicals. Moreover, the system has unlimited flexibility; changes in computer control are primarily changes only in software instructions, such as instrument ranges, alarm limits, or trend recording. With DDC, the plant management staff is continually provided with all types of operating information, pre-calculated and displayed graphically in appropriate engineering units, and accessible at an central location for use. (Prague-FIRL)

**A COMPUTER COMES TO MISSOURI,**
Springfield Water Dept., Mo.
R. D. Plank.
Water and Wastes Engineering, Vol 12, No 4, p 54-56, April, 1975.

Descriptors: *Computers, *Monitoring, *Treatment facilities, *Waste water treatment, *Municipal water, Automation, Data analysis, Measurement, Filters, *Missouri, Digital computers.
Identifiers: Springfield(Mo).

Digital computers are now being utilized to monitor and control the Fulbright water plant at Springfield, Missouri. A Honeywell VupaK on-line data acquisition and process control system monitors 109 separate functions of the municipal treatment and distribution system. Data points measure the total raw water flow into the plant from a reservoir and a spring which is fed from lake watersheds. Three venturi flow devices transmit signals for these measurements. Analog measurements include reservoir, storage tank, and clearwell levels, raw and finished water pH, effluent turbidity at several points, air and finished water temperature, and station pressure. In addition, the computer monitors operation of six mixed-media and dual-media filters, and can initiate backwash from a loss-of head signal or from effluent turbidity. Water quality is measured in a laboratory and manually entered into the computer in terms of residual chlorine, rising well level, inches of rainfall, chlorine tank weight, odor, color, bacteria, and conductivity. Monthly summaries of data on 79 points throughout the system are logged in. Items tabulated by the computer include total finished water, total wash water, total chemicals, and pump running times. This system has found flaws in the plant's previous measuring and control equipment. The operator need not have technical computer training, thus the system is easy for a water department to handle. (Prague-FIRL)

**CALCULATION OF REACTION MECHANISMS IN FERMENTATION BASINS WITH CONTINUOUS FLOW (ZUR BERECHNING VON REAKTIONSABLAEUFEN IN KONTINUIERLICH DURCHSTROEMTEN FERMENTERBECKEN),**
E. Adams, M. Boes, L. Hartmann, and H. Spreuer.
Wasserwirtschaft, Vol 64, No 10, p 294-301, 1974. 12 fig, 13 ref.

Descriptors: *Sewage treatment, Flow rates, *Biological treatment, Mathematical models, Equations, *Fermentation, Treatment facilities, Design criteria, *Waste water treatment.
Identifiers: Germany.

The performance and design of a biological sewage treatment facility with continuous flow is studied mathematically. The plant uses the fermentation process. Data processing and numerical mathematics do not yield reliable approximate solutions for the flows and chemical reactions. Rather, by using the theory of differential inequalities, with rigorous upper and lower bounds, an unknown exact solution of the system is determined. The dependency of the bounds on specific parameters is discussed. (Nave-FIRL)

**RESEARCH ON POLLUTION WITH POLYCHLORINATED BIPHENYLS AND POLYCHLORINATED TERPHENYLS IN SEWAGE PLANTS, (IN JAPANESE),**
T. Kowase, Y. Tsuchiya, Y. Okamoto, K. Yamazaki, and S. Mimura.
Tokyo Eisei Kenkyu Nenho (Annual Report of Tokyo Metropolitan Research Laboratory of Public Health), No 25, p 411-416, 1974. 3 fig, 9 ref.

Descriptors: *Polychlorinated biphenyls, *Sewage treatment, *Waste water treatment, Water pollu-

tion, Activated sludge, Effluents, Influent streams, Industrial wastes, Pollution identification.
Identifiers: *Polychlorinated terphenyls, Coprostanols, Japan.

Research was conducted on pollution by polychlorinated biphenyls (PCBs), polychlorinated terphenyls (PCTs), and coprostanols in sewage treatment plants. When influents, effluents, and activated sludges of some sewage plants were examined, PCBs was detected in all three materials. The maximum value of PCBs was detected in a Ukima, Japan, plant where industrial waste water is treated. PCTs were detected in influents and activated sludges, but not in effluents. The PCTs/PCBs ratio in activated sludges had an average value of 1/17. No correlation between coprostanol and PCBs could be demonstrated; a very slight correlation exists between coprostanol and PCTs. (Prague-FIRL)

**SEPARATION OF PHENOL FROM WASTE WATER BY THE LIQUID MEMBRANE TECHNIQUE,**
Exxon Research and Engineering Co., Linden, N.J.
R. P. Cahn, and N. N. Li.
Separation Science, Vol 9, No 6, p 505-519, 1974. 7 fig, 3 tab, 4 ref.

Descriptors: *Phenols, *Waste water treatment, Emulsions, Oil, Mathematical models, Laboratory tests, *Membrane processes, *Separation techniques.
Identifiers: Liquid membrane emulsion.

A number of systems have been compared for the removal of phenols from waste waters. The liquid membrane emulsion technique, which involves either oil-in-water or water-in-oil emulsions is described as to its performance in small scale laboratory tests. The impurity in the waste water, such as phenol, permeates across the oil membrane in its undissociated form and is then neutralized by the strong caustic or acid inside the aqueous droplets within the emulsion, thus preventing its escape back out into the waste water. A single-stage installation together with make-up, recycle, and disposal is described. Mathematical relationships are derived for the theoretical distribution and for the rate of permeation of phenol into an emulsion. The method is particularly useful where other techniques fail due to the presence of interfering substances, or very high or very low pH. (Prague-FIRL)

**PROBLEMS WITH EFFLUENT SEEPAGE FIELDS,**
Connecticut Univ., Storrs. Dept. of Civil Engineering.
K. H. Healy, and R. Laak.
Water and Sewage Works, Vol 121, No 10, p 64-67, October, 1974. 9 fig, 6 ref.

Descriptors: *Seepage control, *Design criteria, *Septic tanks, Effluents, Soil contamination effects, Hydraulic conductivity, Soils, *Connecticut, Path of pollutants, Water pollution sources, *Soil disposal fields, *Waste water treatment, Waste water disposal.
Identifiers: Seepage fields, Land application.

A rational method of designing seepage fields was investigated. Of septic tank seepage fields in Connecticut that failed, three quarters of them failed because the ground surrounding the field could not absorb the liquid, and the failures were a result of greatly reduced permeability at the soil interface due to biological activity. Design criteria were discussed for land application of an effluent. It was determined that a successful septic tank seepage field must have sufficient soil interface so that effluent application rate does not exceed from approximately 0.3 gpd/sq ft for clayey or silty soils to 0.8 gpd/sq ft for clean sands and gravels. If a potential hydraulic head of 12 inches can be provided, the sides and bottoms of trenches, beds, or pits can be used to compute this area. Also, if the ground surrounding a seepage field must have sufficient hydraulic conductivity to absorb the liquid faster than it is applied. This is a difficult requirement because the hydraulic conductivity is dependent upon a number of factors; these include existing soil permeability, groundwater elevation, and impermeable boundaries. If the designer is made aware of both the hydraulic conductivity and the soil interface area, he can specify site changes such as drainage or filling and should be able to then allow construction of a seepage field for effluent disposal, applicable to specific cases of subsurface disposal of domestic septic tank effluent. (Prague-FIRL)

**THE DEVELOPMENT OF A SCHEME TO CONSTRUCT LARGE DIAMETER SEWAGE PUMPING MAINS ACROSS THE RIVER TEES AND THE TEES RAILWAY MARSHALLING YARD,**
F. M. Firth.
Chartered Municipal Engineer, Vol 102, No 4, p 72-76, April, 1975. 5 fig.

Descriptors: *Sewage, *Waste water treatment, *Pipelines, Design criteria, Construction materials, Interceptor sewers, Water pollution control, Sewage treatment, Rivers.
Identifiers: *River Tees(Great Britain), Surge pressure analysis.

Construction of a two stage sewerage scheme has begun on the River Tees, Great Britain, one of the Country's most polluted estuaries. The first stage, to be completed by 1976, is a system of interceptor sewers, gathering flows to a point on the river where there already is a concentration of major sewer outfalls and where available land exists for a new sewage treatment works. The system will service a population of up to 170,000 with a maximum design flow of 3200 liters/sec. A large amount of variation in flow quantity to be pumped is accommodated by two pipelines of 1.0 m bore and one pipeline of 0.7 m bore. Design velocity within the mains is about 2.0 m/sec with a maximum pumping head of 21 m. Design criteria included possible routes of the pipeline with cost optimization, choice of pipeline material, and analysis of surge pressure. (Prague-FIRL)

**WATER RESEARCH CENTER UNRAVELS THE NITRATE KNOT,**
J. Naughton.
Surveyor, Vol 4285, p 12-16, July, 1974. 6 fig.

Descriptors: *Nitrates, *Water pollution, *Effluent control, *Sludge disposal, Runoff, Sewage effluent, Industrial wastes, Domestic wastes, *Waste water treatment, Activated sludge, Biological filtration, Discharges, Clarification.
Identifiers: *Heteortrophic bacteria, Methanol, Molasses.

The Water Research Center, United Kingdom, has investigated the hazards of nitrates from sewage effluents and other sources reaching drinki
water supplies. An evaluation was made of the d
ferent methods of nitrate removal from sewage e
fluents at the WRC Stevenage Laboratory, co
summated by the start of full-scale trials at the R
Meads Sewage Works on the Lee River. T
method developed resulted in savings in treatme
costs, and in the capital costs of new work
Sewage and agricultural run-off are the greate
contributors to the nitrate problem. Research
Stevenage concentrated on the flooded filter co
cept. The method works on the principle that the
exists a group of facultative heterotrophic bacter
capable of modifying their metabolism to u
nitrate as a source of oxygen when there is no di
solved oxygen. Nitrate removal then can be e
fected by the deprivation of oxygen to a nitrifi
effluent, containing these bacteria. An addition
source of carbon is needed to achieve an adequa
rate of oxygen utilization and denitrificatio
Molasses and methanol are the cheapest ca
bonaceous materials for convenient use. Nitra
removals of about 90 percent are achieved wi
flooded filters, while experiments at low temper
tures showed a reduced efficiency in the filte
below 10 C. (Leibowitz-FIRL)

treatment, *Municipal wastes, *Industrial waste
Sewage treatment, Tertiary treatment, Adsor
tion.

The range and type of waste water treatment un
operations have changed little over the last sixt
years although the volume and nature of municip
and industrial waste waters have changed rad
cally. Activated carbon adsorption is considere
the most important organic removal process to b
developed since the advent of the activated sludg
process in 1912. Activated carbon is a relativel
cheap, non-specific adsorbent with a high capacit
for most waste water organics. Activated carbo
columns are used as tertiary treatment to remov
nonbiodegradable components of waste wate
Water that is directly or indirectly recirculate
needs to have all possible organic matter removed
activated carbon treatment following biologica
oxidation is an economical and reliable method fo
this. Plants are now in operation based on th
physical-chemical treatment procedure. Ra
sewage entering such plants is chemically clarifie
with one of the metal coagulants used i
phosphorous removal such as alum, ferric or fer
rous salts or lime, and a polymeric flocculant
Chemical clarification can remove more than 90%
of the suspended solids in sewage. The clarifie
waste water is fed to activated carbon columns
with or without filtration. The advantages o
physical-chemical treatment over conventiona
treatment included: high organic treatment levels
almost complete suspended solids an
phosphorous removal; good removal of most non
biodegradable organics and trace metal ions; low
required land levels; low initial capital cost; eas
start-up; insensitivity to biological toxins; and
capability of handling highly fluctuating feed con
centration. (Orr-FIRL)

**MASS TRANSFER TO NATURALLY FLOWING STREAMS,**
Delaware Univ., Newark. Dept. of Chemical Engineering.
V. M. Nadkarni, and T. W. F. Russell.
Industrial Engineering Chemical Process Design Development, Vol 12, No 4, p 414-416, 1973. 1 fig, 1 tab, 6 ref.

Descriptors: *Waste disposal, *Design engineering, Streams, *Waste water treatment, Mathematical models, Calculations, Estimating, *Mass transfer.
Identifiers: *Oxygen transfer rates.

Before planning a system of waste water disposal to naturally flowing streams, it is necessary for a process design engineer to estimate rates of oxygen transfer which will occur. In 1964, a typical correlation was developed by Downing and Knowles to calculate the mass transfer coefficient. While their method was an empirical one, a simpler semiempirical correlation is presented which is simpler in form and is superior in its agreement with published data. (Prague-FIRL)

**HIRE AN ACTIVATED CARBON PLANT FOR WASTE WATER TREATMENT,**
Chemviron S.A., Brussels (Belgium). Technical Dept.

C. Bailey.
Progress Engineering, No. 2, p 116-117, February, 1975. 1 fig, 2 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Activated carbon, Oil industry, Chemical industry, Treatment, Organic compounds, Adsorption, Textiles.
Identifiers: Chemviron Adsorption Service, Textile industry, Pharmaceutical industry, Package plants.

The increasingly complex chemical nature of waste streams as well as the more stringent effluent quality requirements has increased the employment of activated carbon treatment systems. A waste water treatment package using activated carbon is offered by Chemviron called the Chemviron Adsorption Service (CAS). The service combines the reliability of carbon adsorption with carbon regeneration and modular engineering. Systems are designed for each specific waste stream. A typical system includes: granular carbon adsorbers; a filtration system; a carbon transfer vessel to assist the periodic carbon replacement; and, pumps and controls. The following classes of compounds are readily adsorbed on carbon: aromatics, phenolics; chlorinated hydrocarbons; surfactants; soluble organic dyes; organic acids; branch-chained aliphatics; and high molecular weight amines. CAS offers an economical treatment process for both large and small firms; it provides guaranteed treatment objectives while involving no major capital investment by the user. Industries now using activated carbon treatment include the textile, petroleum, chemical, and pharmaceutical industries. (Orr-FIRL)
W75-10346

**UPGRADING EXISTING WASTEWATER TREATMENT PLANTS--CASE HISTORIES.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
Seminar Publication, August, 1973. 20 p, 11 fig, 6 tab.

Descriptors: *Waste water treatment, *Activated sludge, *Trickling filters, Nitrification, Biological treatment, Retention, *Treatment facilities.
Identifiers: Hydraulic-retention, *Technology transfer.

Case histories are presented which relate to upgrading the performance of activated sludge and trickling filter plants through modification of the biological processes. In these processes, the biochemical reaction rates depend on the concentration of the wastes and on the appropriate microorganisms capable of feeding on the wastes. Inadequate hydraulic-retention or contract time and solids retention time are the factors which may limit the actual plant performance to a less than optimum level. In addition to the case histories, an outline is presented which lists the process modification or addition and when to use it. The process modifications include: tightening process control; adding final tank capacity; increasing aerator solids level; increasing air supply or improving air distribution; increasing contact time; dividing the reactor into multiple compartments in series; contact stabilization; step aeration; completely mixed activated sludge; positive ventilation; media change; increasing recirculation; activated sludge recirculation; high rate trickling filters; activated sludge; and, a nitrification trickling filter. **OZONE CHEMISTRY AND TECHNOLOGY-A REVIEW OF THE LITERATURE: 1961-1974,**
Franklin Inst. Research Labs., Philadelphia, Pa. Science Information Services Dept.
J. S. Murphy, and J. R. Orr.
Franklin Institute Press, Philadelphia, Pa, 1975. 392 p.

Descriptors: *Reviews, *Ozone, *Waste water treatment, Publications, Equipment, Instrumentation, *Bibliographies, Chemistry, Polymers.
Identifiers: Organic chemistry, Inorganic chemistry, Ozonization, Literature reviews.

The worldwide chemistry literature was thoroughly reviewed from 1961 to 1974 for all aspects of ozone chemistry and technology. Eleven state-of-the-art overviews covering nine subject areas comprise the body of the book with over 3,000 bibliographical entries as supportive material. The subject areas include the effects of ozone on vegetation, the effects of ozone on animals, ozone treatment of waste water, ozone in organic chemistry, ozone equipment and instrumentation, ozone involvement in atmospheric chemistry and meteorology, ozone in inorganic chemistry, ozone general chemistry and technical applications, and ozone in polymer chemistry. Thorough subject and author indexes are also included. (Orr-FIRL)

## 5E. Ultimate Disposal Of Wastes

**DISPOSAL OF WASTE STREAMS CONTAINING ASBESTOS,**
Dow Chemical Co., Midland, Mich. (assignee)
T. F. Lagess, and V. H. Maudlin.
US Patent No 3,887,462, 4 p, 6 ref; Official Gazette of the United States Patent Office, Vol 935, No 1, p 293, June 3, 1975.

Descriptors: *Patents, *Waste disposal, *Underground waste disposal, *Waste disposal wells, *Asbestos, Limestones, Alkaline earth metals.
Identifiers: Settling agents, Waste asbestos.

Waste asbestos carried in aqueous waste streams can be safely disposed of in underground cavities. Problems associated with such method of disposal in underground cavities, from which it may be desired to extract aqueous streams, are overcome by contacting the asbestos with a relatively dense settling agent which attaches to the asbestos and causes it to sink to the bottom of the cavity. The settling agent may be a finely divided rock or mineral, especially one which contains appreciable amounts of alkaline earth metal compounds. In some instances, relatively small amounts of water-soluble or water-miscible organic flocculating agents are added to aid the settling. Care should be taken to avoid aeration of the asbestos slurry because the asbestos, which contains tiny pores and voids, can capture small air bubbles within its fibrous structure and this makes settling more difficult. **UNDERGROUND LIQUID WASTE DISPOSAL.**
American Society of Civil Engineers, New York. Task Committee on Underground Liquid Waste Disposal.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 101, No HY3, p 421-435, March, 1975. 10 tab, 18 ref.

Descriptors: *Waste water disposal, *Indus wastes, *Underground waste disposal, W disposal wells, Injection wells.

A discussion underground liquid waste disposa cludes the following topics: information on the tent and character of underground liquid w disposal and the status of regulation in the U assessment of the impact that this disposal is ing and will have on the environmental and int ty of groundwater resources; and, recommen tion of appropriate courses of action to mon control, limit, or prohibit underground li waste disposal. Although the chemical industr the largest user of injection wells, a variet other industries also have constructed such w Most existing wells are between 1,000 and 6 feet deep. Ninety-five percent of existing w have average injection rates of less than 400 and 99 percent inject at average well-head p sures of less than 1,500 psi. Few examples of tamination of fresh groundwater were found. reported instances of degradation of o resources were found. Waste water with l quantities of dissolved inorganic chemicals are most likely to be injected. Any future restricti on injection will include that treatment must performed prior to injection. The policy of Ohio River Valley Water Sanitation Commissio presented as a rational basis for control of derground liquid waste disposal. (Orr-FIRL)

oxidation of sewage sludge is achieving ls of technology and performance. A task the Environmental Protection Agency d a report in 1972 which stated that ncineration processes were an acceptable e for sludge disposal. Sludge incinerator designed to meet existing air quality stan-roduce acceptable stack emissions of oxides, sulfur oxides, odors, and particu-er. The total destruction of PCB, a type of chemical found in sewage sludges which degradable, is possible when oxidized in ion with sewage sludge. A schematic fur-resentation is presented of an advanced pe unit being constructed for the Liver-ater Reclamation Plant, Livermore, a. The top third of the furnace is the dry-fresh sludge in this section is dried by the m the combustion zone. The middle sec-ne furnace is where combustion of the ds occurs. The remaining ash cools in the rd of the furnace. Livermore also has plans for a separate multiple hearth furnace to recalcine or reclaim lime used in the treated process. Sludge incineration by the new methods will contribute less pollutants to the air than the 'clean' car of 1976. Sludge incineration is also an environmentally sound method for disposing of industrial liquid wastes. (Orr-FIRL)

WATER CHLORINATION METHODS,
Capital Controls Co., Inc., Colmar.
K. A. Moyer.
Water and Sewage Works, Vol 121, No 9, p 64-65, September 1974. 2 fig.

Descriptors: *Chlorination, *Water treatment, *Waste water treatment, *Chlorine, Equipment, Water quality control, Water purification, Disinfection, Sewage treatment.
Identifiers: Compound loop control.

Chlorination of waste water to destroy pathogenic, disease-producing organisms and avoid other forms of water degradation is used in almost all municipal and industrial water treatment applications. Chlorine gas is considered the best source for almost any chlorination were large volumes of water are to be chlorinated to high levels because it is a pure substance, it lowers pH slightly, is easy to control and apply, and is the cheapest source of chlorine based on pounds of available chlorine. Choosing the proper chlorination system depends on the chlorine demand, the amount of chlorine required to react with the organic and inorganic substances and to kill the bacteria; the chlorine dosage, the amount of chlorine put into the water; the chlorine residual, the amount of chlorine remaining after a specified contact period; and, the flow rate of the water. A water treatment plant that processes water with a constant chlorine demand but that experiences rapid, wide-ranging daily flow variations could use a flow proportioning chlorinator to automatically meter exact amounts of chlorine into the water. When the chlorine demand of the water source varies, it is necessary to use an amperometric instrument to automatically and continuously measure levels of chlorine residual. The best automatic chlorine feeding system is compound loop control. This is needed when both the water flow rate and chlorine demand vary significantly in the body of water being treated. It is a combination of a flow proportioning chlorinator and a chlorine residual control system. (Orr-FIRL)
W75-09910

WATER TREATMENT WITH OZONE.
Netherlands Patent 32218U/23. Issued November 6, 1974. Derwent Netherlands Patents Report, Vol 47, No 1, p 1, December 31, 1974.

Descriptors: *Patents, *Ozone, *Water treatment, Filters, Activated carbon, Construction materials, Filtration, Waste water treatment.
Identifiers: *Filter beds.

Water is treated with filtration and reduction of the ozone residue steps. The filter bed is described. This is composed of a uniform mixture of granular inert natural or synthetic microporous material, as well as granulated activated carbon of a similar physical nature. The best types of natural or synthetic components are those which are chemically reactive. (Prague-FIRL)

FILTRATION OF WATER WITH A HIGH IRON CONTENT,
Viak A.B., Vallingby (Sweden).
A. Hult.
Effluent and Water Treatment Journal, Vol 14, No 5, p 265-267, May 1974. 3 fig, 2 tab, 2 ref.

Descriptors: *Groundwater, *Iron, *Manganese, *Filtration, *Oxidation, Potable water, Water supply, Public health, *Water treatment, Hydrologic aspects.

Iron is present in groundwater in many countries in amounts greater than 0.2 ppm, or exceeding the standards for potable public water supply. Effects of this excess of iron are a bad taste in the water and staining of laundry. Iron is commonly removed by precipitation through oxidation and filtration. Oxidation may be produced by aeration, sometimes combined with an increase of the pH value, or by adding oxidation agents other than air. Manganese in groundwater causes similar problems. Both field and laboratory investigations are necessary to determine the proper treatment for water containing iron or manganese. Satisfactory results were obtained by filtration of water with a very high iron content when the following factors were considered: suitable gradation of the filter material; choice of suitable alkali; and oxidation during filtration. **EFFECTS OF DEPOSIT RESUSPENSION ON SETTLING BASIN,**
Kyoto Univ. (Japan). Dept. of Chemical Engineering.
T. Takamatsu, M. Naito, S. Shiba, and Y. Ueda.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 100, No EE4, Paper No 10705, p 883-903, August 1974. 18 fig, 4 tab, 74 equ, 12 ref.

Descriptors: *Environmental engineering, *Settling basins, *Dispersion, *Depth, Water treatment, Scour, Estimating, Optimization, Equations, *Mathematical models, Systems analysis, Waste water treatment, Model studies.
Identifiers: *Boundary value problems, *Scouring, Eigenvalues, Dispersion model, Prediction.

Scouring of deposits is one of the major factors in designing sedimentation basins for water and wastewater treatment systems. To express the degree of deposit resuspension, a scouring parameter is introduced into a dispersion model. The parameter is taken into account in one of the boundary conditions of a two-dimensional diffusion equation, which is simplified into a one-dimensional dispersion model. The scouring parameter is related to the longitudinal dispersion coefficient by a model experiment. On the basis of the mathematical expression developed, the existence of the optimum depth of a rectangular settling basin has been theoretically predicted and has been experimentally verified. (Bell-Cornell)

**ZETA POTENTIAL CONTROLS DIRECT FILTRATION COAGULATION,**
R. D. Letterman, and R. D. Tanner.
Water and Sewage Works, Vol 121, No 8, p 62-65, August, 1974. 9 fig, 2 tab, 12 ref. OWRR A-062 ILL(1).

Descriptors: *Water treatment, *Filtration, *Polymers, *Zeta potential, Polyelectrolytes, Turbidity, Water quality control, Water quality, Coagulation, Pilot plants, Illinois, Waste water treatment.
Identifiers: *Direct filtration, Chicago(Ill).

Currently growing is the practice of designing water treatment plants treating low turbidity water without the conventional sedimentation basins and flocculators and feeding coagulant treated water directly to the filters. The results are presented from a six month study using pilot filters at the Central Water Filtration Plant in Chicago, Illinois, and water from Lake Michigan to demonstrate how particle zeta-potential measurements can be used to determine the cationic polyelectrolyte concentration needed for effective operation of the direct filtration process. The polymers studied, Cat-Floc T, Nalcolyte 607, Nalcolyte 8101, and Magnifloc 570-C, each demonstrated an effective concentration range and an optimum concentration. The effective range corresponded to particle zeta potentials in the range -6 to 26 mv. The optimum concentration corresponded to a zeta potential of about 14 mv. When the optimum polymer concentration was achieved, maximum turbidity removal, maximum head loss development, and a shortened ripening period resulted. The amount of polymer that was required to reach a given particle zeta potential increased slightly as the influent water turbidity rose from 0.6 to 35.0 FTU. The effluent turbidity was independent of the influent turbidity in the effective concentration range. The rate of head loss buildup depended to a significant degree on the type of polymer utilized but the turbidity was effectively removed by all the polymers studied. (Ott-FIRL)

**CHARACTERISTICS OF GAS-LIQUID CONTACT APPARATUS IN OZONE TREATMENT FOR DRINKING WATER, (IN JAPANESE),**
N. Tabata.
Suido Kyokai Zasshi, No 482, p 16-27, November, 1974. 25 fig, 7 ref.

Descriptors: *Water treatment, *Ozone, *Potable water, Flow rates, Ultraviolet absorption, Flow, Water temperature, Instrumentation, *Waste water treatment.
Identifiers: Ozonemeter, *Gas-liquid contact.

The chemical and physical behavior of ozone in drinking water was studied during the construction of an efficient reaction bath of drinking water sterilization by ozone. Experiments were conducted using a 5 m resin tube (15 cm in diameter) with several sampling side tubes at different positions for ozone analyses. The ozone was bubbled from the bottom of the tube and water flowed in with either countercurrent or cocurrent motion against the ozone flow. Analyses of ozone were made by a UV absorption ozonemeter or by iodometry. Drinking water was boiled to exclude the dissolved chloride ion. The ozone absorption by water was more efficient in the countercurrent experiment than in the cocurrent experiment owing to a mixing effect. At a constant ozone flow rate, the dissolved ozone concentration increased with increasing reaction path length for the countercurrent experiment. However, the cocurrent experiment gave an increased concentration (1.5 g/cu m) up to 2 m reaction path length, but no further increase in the concentration was obtained with a longer path length. The water flow rate affected ozone absorption in that the increased flow rate decreased ozone absorption for the cocurrent experiment, but increased flow rate for countercurrent experiment, indicating more vigorous mixing between ozen and water. The decomposition constant of ozone was shown to be dependent on water temperature and water qualities. (Katayama-FIRL)

**MICROBIAL DEGRADATION OF PETROLEUM,**
Bioteknika International Inc., Alexandria, Va. (assignee).
E. N. Azarowicz.
U S Patent No 3,856,667, 6 p, 2 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 929, No 4, p 1698, December 24, 1974.

Descriptors: *Patents, *Oil pollution, *Microbial degradation, *Microorganisms, *Water pollution control, Water quality control, Oily wastes, Industrial wastes, *Pollution abatement.

A process for the microbial degradation of petroleum or oil waste materials is comprised of treating the petroleum or oily waste with a strain of Candida lipolytica for a sufficient time until degradation has been achieved. The microorganism strains employed have a broad spectrum of degradation capability and are capable of degrading crude petroleum as well as variety of organic molecule including aliphatic, aromatic and heterocyc compounds. The distinct unique advantages that the non-toxic microorganisms employed derived originally from edible substances wh are not toxic. The process can be used to remo oil spillage on the open sea, on sandy beache shingle beaches, rocky coast lines, harbors, a inland waters, or oily waste effluent materi discharged from industrial plants. There is restriction as to the fraction of petroleum which degradable. The microorganisms are seeded dispersed over an oil-spilled area by means boats, aircraft or other vehicles as appropria The mixture employed preferably includes a cell lose absorbent to prevent the oil from spreadin Additive nutrients for the microorganisms are al mixed with the absorbent. (Sinha-OEIS)

**PROCESS FOR CONTROLLING OIL SLICKS,**
S. W. Miranda.
U S Patent No 3,886,067, 5 p, 4 fig, 1 tab, 10 re Official Gazette of the United States Patent O fice, Vol 934, No 4, p 1592, May 27, 1975.

Descriptors: *Patents, *Oil spills, *Oil pollutio *Water pollution control, Water quality contro *Foaming, Polymers, Resins, Skimming, Pollutio abatement.
Identifiers: Oleophilic foam.

Oil slicks on surface waters are controlled by a plying oleophilic foam material to the slick from boat or airplane. The foamable liquid can compris many different components which react to form a oleophilic foam material. The reactants in thi spray process are preferably compatible with o and can react with up to 75 percent by weight o oil. They preferably comprise a pre-formulate polymerizing system adapted to compensate fo properties of a wide variety of oils and include polymerizing agent component and a resin com ponent. These two components when mixed, reac at ambient temperature to form solid foa products. In one form the boat or aircraft contain means for separately spraying liquid streams o reactive resin foaming materials onto the wate surface to react with and bind the oil to form parti cles of foam or sponge-like clods which can b skimmed from the water surface. In another em bodiment the reactive chemicals are combined o board the craft to form a body of oleophilic foa which is then fed to a chipper and applied to th slick. (Sinha-OEIS)

**INDUSTRY VIEWPOINT (WATER QUALITY CONTROL),**
Mobil Oil Corp., New York.
A. R. Aitkins.
Natural Resources Lawyer, Vol 7, No 2, p 241-247, 1974. 20 ref.

Descriptors: *Federal Water Pollution Control Act, *Permits, *Oil pollution, *Water pollution, Water pollution control, Legal aspects, Penalties(Legal), Law enforcement, Regulation, Administration, Control, Discharge measurement, Political aspects, Research and development, Planning, Legislation, Water law, Constitutional law, Administrative agencies, Industrial wastes.
Identifiers: Oil discharges.

The Federal Water Pollution Control Act provides civil penalties for industries which discharge harmful quantities of oil. Section 311 defines a discharge in harmful quantities to include among others any that causes a film or sheen upon the surface of the water. But under Section 402, industrial users can get a National Pollutant Discharge Elimination System permit allowing oil discharges if the permittee is using the best practicable control technology and if he works within the specified permit limits. It is argued that the Congressional intent was to exempt permittees from

ion 311 penalties. The Environmental Protec- Agency (EPA) and the Coast Guard, however, that penalties can be imposed for a sheen even n the discharge is a permissible one quantita- y under Section 402. If the 'sheen' test is to be permittees should be allowed to show that the harge either was not harmful or was within the it quantitative limit. The constitutionality is tioned of the Section 311 penalties which are sed regardless of the fact that the discharge have been caused by an Act of God, an act of negligence of a third party and other things. standardization of permits is useful in order to permittees to similar standards and avoid cious application of the law to individual argers, but too much standardization can be ful. **RESEARCH NEEDS AS RELATED TO THE DEVELOPMENT OF SEDIMENT STANDARDS IN RIVERS,**
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. Gessler.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-243 776, $3.75 in paper copy, $2.25 in microfiche. Colorado Environmental Resources Center, Fort Collins, Completion Report Series, No 60, May 1975, 35 p. OWRT A-025-COLO(1) 14-31-0001-4006.

Descriptors: *Research priorities, Sediments, Standards, Water quality, Rivers, *Water quality standards, Biota, Geomorphology, Hydrology, *Sediment distribution, Sedimentation.
Identifiers: *Research needs, *Sediment standards.

Standards for the sediment load in rivers and streams must be set and enforced at the tributary streams, else it becomes impossible to locate important sediment sources. Such standards need to be very sophisticated and must relate to the full grain size distribution of the moving sediment for geomorphic and biotic reasons. Such standards must be related to a few key parameters: the hydrology; the geomorphology; and the biota of the river. Each of these factors may not vary significantly within one region. Furthermore, the first two are so highly correlated that a separation may not be necessary. Instead of mapping each stream it may then be sufficient to map regions. Any combination of geomorphic and biotic characteristics of the region would then determine the standards applicable to the region's streams. (Evans-Colorado State)

Available from the National Technical Information Service, Springfield, Va. 22161, as PB-242 827, $6.25 in paper copy, $2.25 in microfiche. Environmental Protection Agency, Report EPA-660/2-75-005, April 1975. 155 p, 27 fig, 54 tab, 15 ref, 2 append. EPA 1BB039, S801040.

Descriptors: *Irrigation, *Return flow, *Drainage, *Salinity, *Model studies, *Soil water movement, Nitrogen, Sprinkler irrigation, Management, Water quality, Fertilization, Tile drains, Path of pollutants, Water pollution sources.

Field and laboratory research was conducted to determine the effects of irrigation management and fertilizer use upon the quality and quantity of irrigation return flow. The total seasonal discharge of salts from the tile drainage system was directly related to the quantity of water discharged, because the solute concentration of the ground water was essentially constant over time. Under such conditions, reduction of salt content of return flow is accomplished by reduced drain discharge. Irrigation management for salinity control must be practiced on a major part of a particular hydrologic unit so that benefits are not negated by practices in adjoining areas. Field studies and computer models showed that salts may be stored in the zone above the water table over periods of several years without adversely affecting crop yields on soils with high 'buffering' capacity as encountered in this study. However, over the long term, salt balance must be obtained. Appreciable amounts of nitrate moved into drainage water at depths of at least 106 cm from the applications of commercial fertilizer and dairy manure to ground surface. Submergence of tile drains in the field reduced nitrate concentrations in the effluent, especially under heavy manure applications. (EPA)

**COOPERATION COMBATS OIL SPILLS IN NORTH CAROLINA.**
Fueloil and Oil Heat, Vol 34, No 2, p 24-25, February 1975.

Descriptors: *Oil spills, *Water pollution control, Costs, Equipment, Planning, *North Carolina.
Identifiers: Oil boom, Oil skimmer, Oil spill protection.

Oil spill control in Randolph County, North Carolina has been incorporated into the county Rescue Squad operation. The Randolph County Oil Dealers Association decided in the spring of 1974 to plan for protection against major oil spills, and that members should cooperatively purchase pollution control equipment. Out of 29 area fuel dealers, 25 contributed to the project. The members have purchased a trailer with boom, skimmer, and oil absorbent, costing a total of $8000. A test using styrofoam pieces to represent oil was demonstrated for the public on Dula Lake; the entire clean-up was performed by rescue squad members, with dealers assisting only. The Ashe-Rand Rescue Squad has trained 25 of its members specifically for the use of oil spill containment equipment. In the event of a spill, the dealer responsible for the accident will pay for materials used, such as absorbent foam or fuel. (Prague-FIRL)

Descriptors: *Oil pollution, *Oil spills, *Environmental effects, *Transportation, Demand, Oil industry, Alaska, Earthquakes, Oil fields, Arctic, Water pollution control, Probability, Routing, Climatic zones, Ocean currents, Tides.

With the anticipated increase in oil production, practically every mile of the mainland Alaska coastline will be subject to potential oil spills. The hostile environment of Alaska and the remoteness of most potential production areas makes the cleanup of offshore oil spills difficult to impossible for the U.S. Coast Guard, whose mission includes the prevention and control of oil spillage. In order to aid the long-range development of policy and technology to deal with problems associated with oil spills in Alaska, a discussion of the future of crude oil demand and transportation, the environmental conditions in potential spill areas, the expected behavior of oil in spill areas, and spill potential are discussed. The incidence of oil spills is a function of the location and amount of crude oil produced, production methods, the mode and route of transportation, the type and frequency of intermodal transfers, and the geographic and environmental setting of all handling operations. Recommendations to the Coast Guard include a review of present capabilities with emphasis on aircraft potential for detection and control of spills in the future, and the acquisition of a more extensive understanding of true environmental consequences of a spill. Current controversy over pollution control and abatement involves warnings from many people on the dangers of relaxing air and water standards, while many industry spokesmen urge the loosening of environmental rulings as an anti-inflation measure. Industry leaders are asking the government to weigh the public benefits from the regulatory programs against the public costs such as price increases resulting from passing on the costs of pollution abatement programs and jobs lost from the diversion of funds from installation of production plants. The EPA took 2846 enforcement actions against violators of water, air and pesticide laws between January, 1973, and March, 1974; fines and penalties imposed on polluters since December, 1970, total over $8,200,000. The EPA has developed an effective, quick-acting enforcement team to insure that the environmental laws will achieve cleaner air and water and safer use of pesticides. Industries have realized the penalties for polluting and have begun long-range plans of pollution abatement. The majority of companies responding to a recent survey of industrial pollution control expenditures state that neither future energy conservation programs nor higher energy prices will have significant effects on their long-range anti-pollution efforts. Some of industry's newest pollution control techniques will have applications also for sewage and water treatment. Ozone may soon replace chlorine as the
ceptable water purifier. Ozone the treatment of
fluent water from a sewage plant is able
economically meet Public Health Service requ
ments for potable water. (Orr-FIRL)

The problems and increased cost of analytical
ing and pollution abatement associated with
Effluent Guidelines and Standards, published
the Environmental Protection Agency on Jul
1974, are discussed. The BOD requirements
considered too stringent and impractical and u
tainable except at great cost. COD should not
required parameter because the mercury and si
used in the analysis may cause more harm to
ecology and economy than the large volume o
ganic wastes being investigated. Phenol should
have been considered a separate param
because it is rapidly oxidized and comple
removed in the activated sludge process. For
same reason, sulfide should not be a sepa
parameter. The APHA color determination is
ficult and confusing. Color determinations or c
removal should not be required except when
color of the receiving stream is significantly
tered visually. This listing of many parame
results in increased costs. The ruling that C
phenol, sulfide, and oil and grease are incomp
ble water pollutants which will interfere with
operation of municipal treatment plants is in
rect since these substances are now being tre
in activated sludge plants without lowering
ciency. Following this regulation means that
sentially double treatment will occur as the pl
must pretreat their wastes before joint treatme
allowed. The neutralization of an alkaline p
also unnecessary and even disadvantageous. (

Gasoline spills.

islation requires each state to protect of its surface waters, yet this protec- d only indirectly for subsurface waters. rface waters/groundwater evaluation grated in water quality monitoring, the nsylvania was one of the first to design nsive Water Quality Management Plan ) to protect groundwater as a vital ver two-thirds of that state's public y and 99% of its private water supplies nt upon groundwater. The slow migra- tion of contaminated surface water has been demonstrated to cause groundwater pollution. Examples of this are landfill leachate, leaking industrial water impoundments, gasoline spills flushed to the soil, improperly developed spray irrigation sites, and urban runoff infiltration. The COWAMP plan considers groundwater in its role as a major water supply, including new developments in well construction. Groundwater is also seen as a transporting medium for contaminant dispersion; for example gasoline spills move on top of the water table and fumes may migrate up through the soil into buildings as it flows. Additionally, activities affecting the recharge/discharge balance influence waste water treatment and related costs. COWAMP hopes to identify existing hydrogeological characteristics, to study man's impact on existing resources, and to evaluate alternatives. This involves considering areas of poor water quality, areas requiring special protection, such as recharge zones, important watersheds, large population centers, and areas where major population growth is predicted. **LEGISLATIVE HISTORY OF THE SAFE DRINKING WATER ACT,**
House, Washington, D.C.
P. N. Kyros.
Journal of the American Water Works Association, Vol 66, No 10, p 566-569, October 1974. 4 fig.

Descriptors: *Public health, *Potable water, *Water supply, Standards, *Legislation, Regulation, Water quality control, Water purification, *Water quality standards, *History.
Identifiers: *Safe Drinking Water Act.

A brief history of the Safe Drinking Water Act, the need for such legislation, some of the legislative obstacles encountered, and the major provisions of the final bill are discussed. Federal legislation concerning the safety of drinking water has been in the House since 1970. The need for such a bill was highlighted by many newspaper reports of concern over the quality of water and a HEW study conducted in 1969 and 1970 which concluded that approximately 5.4% of all US citizens were being served substandard water from approximately 5000 community water systems. Federal standards have been in effect since 1914 concerning the quality of potable water provided on interstate carriers and standards are now necessary to cover all aspects of water quality. Obstacles encountered included objections letting the EPA administer such a project, loss of interest after the Water Pollution Control Act of 1972 was passed, and the difficulty in knowing exactly what to legislate for or against. The Safe Drinking Water Act provides for the control of underground-injection programs to protect against endangering drinking water sources. Under this bill, the states will have the primary enforcement responsibility to monitor and inspect community water systems to assure their compliance with federal standards; the states will also have the power to grant variances to systems because of the characteristics of the raw-water source or because a required treatment technique is not necessary. Federal funds for research and demonstration projects also are part of the bill. (Orr-FIRL)

Journal of the Hydraulics Division, Proceedings of ASCE, Vol 101, No HY7, p 989-1002, July 1975. 6 fig, 10 equ, 44 ref.

Descriptors: *Water management(Applied), *Water quality control, *Stochastic processes, *Simulation analysis, Mathematical models, Variability, Planning, Design, Evaluation, Performance, Economics, Standards, Equations, Systems analysis, Waste water treatment, Estimating.
Identifiers: Sensitivity.

Mathematical models are employed in the design, performance prediction, and evaluation of alternative water quality management programs. Examined is the relative influence of deterministic and stochastic models on water quality management decisions to demonstrate some deficiencies of decisions based on mean estimates produced by deterministic models. Water quality management problems are studied which consider the implications of variability in waste generation, treatment plant performance, and receiving water behavior on the resulting variability of water quality. An example is provided in an evaluation of regional wastewater management alternatives given by the size, number, and location of regional treatment plants. It is concluded that an evaluation of water quality management alternatives without consideration for their performance variability may be so deficient as to negate the evaluation. (Bell-Cornell)

**OBJECTIVES OF WATER QUALITY PLANNING,**
Kansas Water Resources Board, Topeka.
K. S. Krause.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 101, No HY3, Paper No 11200, p 471-476, March 1975.

Descriptors: *Water resources, *Planning, *Water quality control, Hydraulics, Decision making, Land use, Natural resources, Conservation, Irrigation, Education, Public health, Environment.

Planning is a useless effort if it does not produce a viable procedure for reaching its objectives. Our political process is presently atuned to crisis reaction, producing short-range decisions and simplistic solutions to problems which often serve to confuse and delay the adoptions of hard viable solutions. The control of water quality is a noble objective in itself; however, the need for it is symptomatic of a much deeper and profound disease that must be cured or prevented before a completely successful water quality control program can be achieved. The disease is that of 'living beyond our resource means'. To overcome this, the national objectives should be to: (1) minimize natural resource waste; (2) protect the public health and ecosystems; (3) provide for a system of control that has a practical probability of being achieved; and (4) provide for a positive decision-making process that leads to the rapid consumation of the objectives previously stated. Identifiers: *Multi-cost system optimization, Performance criteria, Artificial aeration, Dumping, Treated waste.

The application of optimal control techniques to ecological systems is discussed. Specifically, the control of pollution of water in a river stream is considered. The variables to be controlled are the concentration of biochemical oxygen demand and the level of dissolved oxygen. To achieve this, a procedure is presented for controlling dumping of industrial effluents and/or artificial aeration. A realistic determination of the optimum values of these controls is subject to several performance criteria relating to water quality. Since some of these criteria are contradictory, the problem is considered from the point of view of a multi-cost system. A lumped parameter state variable model is derived. Recently published theory on multi-cost system optimization is utilized, and numerical examples are presented. This procedure, which accounts for all the costs simultaneously, has an added advantage over existing methods in that not only can a linear combination with undetermined weighting factors be treated, but other functions of the costs can also be used. Tufts Univ., Medford, Mass. Dept. of Civil Engineering.
L. C. Brown.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 100, No EE5, Paper No 10849, p 1051-1068, October 1974. 5 fig, 6 tab, 13 equ, 21 ref.

Descriptors: *Water pollution control, *Statistical methods, *Atmosphere, *Mathematical models, *Environmental engineering, Regression analysis, Sanitary engineering, Least squares method, Equations, Hydraulics, Natural streams, Data collections, Systems analysis, Forecasting.
Identifiers: *Reaeration coefficient, Prediction error, Oxygen transfer.

The object of much of the experimentation in atmospheric reaeration of natural streams is to develop models for predicting the reaeration coefficient k sub 2. These prediction equations are statistical correlations of the hydraulic variables and fluid properties thought to be important in affecting k sub 2. Two previously reported models for predicting k sub 2 are reevaluated in the light of these criteria. Although the models are useful for estimating k sub 2, they do not adequately describe the variation in the observed data because their prediction error is significantly larger than the experimental error. Finally, the two statistical models are used to predict k sub 2 from data from a third, independent source. The prediction error varies between a factor of 2 - 3 about the predicted value. Comparison with values predicted by a model founded in the penetration theory for gas absorption is favorable. This suggests that theoretical models hold more promise than empirical correlations as a source for equations to predict k sub 2.

**SHORTCUT METHODS TEST ALGICIDES,**
Wisconsin Univ., Madison.
G. P. Fitzgerald.
Water and Sewage Works, Vol 121, No 9, p 85-87, September 1974. 5 tab, 12 ref.

Descriptors: *Algae, *Algal control, *Algicides, *Copper, Analytical techniques, Algal toxins, Phosphorus, Water treatment, Copper compounds, Water pollution control, Pollutant identification.

Rapid methods have been developed to determine the effectiveness of algicide applications. The effectiveness of various algicides can be demonstrated within one day's time by measurements of the ability of the algae to absorb PO4-P; dead algae do not absorb phosphorus. The previous procedure involved waiting at least a week and measuring the algae growth. The procedure designed can be adapted to planktonic algae, filamentous algae, or aquatic plants. The procedure combines nutritional tests for phosphorus with algicide applications to determine the relative effectiveness of algicides. The effect of various dosages of chemicals over different time periods on the ability of algae to absorb phosphorus or the phosphorus content of the algae were correlated with the death of the algae as determined By growth tests. The results of experiments performed using different copper products as algicides showed that: this test could be utilized to evaluate the relative effectiveness of algicides under different environmental conditions such as duration of treatment, pH, water hardness, or the presence of silt or dissolved organic matter; either the concentration of algicide or the treatment duration can be regulated to produce an effective treatment; the source of copper used as the algicide will determine the treatment duration or concentration required for a particular level of effectiveness; and, the minimum amount of algicide to be effective is related to the amount of algae present and is not related to the volume in which the algae are suspended. Identifiers: Ocean disposal, Petrochemicals.

Ocean disposal of municipal and industrial wastes has been strongly opposed, particularly by residents of Delaware, Florida, and New York. Recent legislation, such as the Marine and Sanctuaries Act of 1972 (P.L. 92-532) is discussed. In the fall 1972, an International Convention on the Prevention of Marine Pollution by Dumping of Wastes was held which specified certain materials which could not be released and restrictions on the quantities of other materials. The process of application and granting of permits to release wastes to marine waters is complicated, and involves regional jurisdiction of the EPA. Ocean dumping criteria include materials which are absolutely prohibited, such as high-level radioactive wastes, biological, chemical or radiological warfare agents, or persistent inert synthetic or natural floating materials; materials prohibited in other than trace quantities, such as mercury, cadmium, organohalogens, and oils and greases; strictly regulated materials, including petrochemicals, organic chemicals, and organic processing wastes, inorganic processing wastes, biocides, immiscible materials, and other wastes which might cause hazard to navigation. Types of ocean dumping permits are detailed. The pollution and ocean impact by ocean outfalls discharging sludge is also co
pared with potential hazards of ocean dumping
wastes. (Prague-FIRL)

Colgate Creek(Md).

The degradative capabilities of naturally-occurri
microorganisms in Chesapeake Bay are assess
by sampling on a regular basis. One area, that
Colgate Creek, is contaminated with petroleu
compounds, including cosmoline (a wax used
protect automobiles during Atlantic transpor
kerosine (used to wash wax from the autom
biles), motor oil, and tanker fuels. A study w
conducted to determine whether or not a corre
tion exists between numbers of petroleum-degra
ing microorganisms with amount of petroleum-li
material routinely extracted from sediment. In a
dition, a comparison is made of several metho
and solvents for extraction of estuarine water a
marine sediments. Comparison of the amount a
proportional representation of each compone
extracted, as determined by mass spectrometr
indicated that the material contained the hydroca
bons found in petroleum. The most effective s
vent found for the extraction was benzene
benzene-methanol azeotrope. A method
reciprocal shaking, employing benzene as the s
vent was thus determined to be the most efficie
extraction of petroleum hydrocarbons from bo
estuarine and marine sediments. (Prague-FIRL)

analysis, Water quality control, Managemer
Planning, Operations, *Dynamic programmin
*Linear programming, Municipal water, Math
matical models.

The effectiveness of a systems analys
framework for planning water pollution contr
systems is investigated. A dynamic programmi
model was used under deterministic and stochast
conditions; a water quality index was used to o
tain optimal operating policy. A metropolit
economic-engineering urban water quality syste
was defined. Mathematical modeling and pr
gramming techniques are used to study intera
tions between physical, technological, economi
and social aspects of the problems of urban wat
quality management. A linear programming mod
was used for the definition of minimum requir

nent in the waste water control system and
e delineation of an optimal allocation of
ces within this system. Additionally, com-
imulation models are utilized for predicting
veness of the water pollution control
. (Prague-FIRL)

Pollution abatement, Local governments,
government, Federal Water Pollution
Act, Water permits, Regulation, Water
overnment interrelations, *Federal-state
ghts conflicts.
ers: *Federal Water Pollution Control Act
ments of 1972.

ssion is presented to show why and how
l system of the Federal Government an-
demands for a more effective water pollu-
ntrol system and, in the process, how the
of the Federal Government in this area
increased and the states' powers
ed. Areas of interest include: the authority
s to regulate the quality of water within
ritorial limits (or their police powers); the
states to commence an action in Federal
Court to restrain a polluter from con-
ng the waters of a state from a point out-
boundaries; the doctrine of federal
tion which renders null and void state laws
in which Congress has acted (Minnesota
vented from having more strict laws about
power plants than the AEC allowed); the
tencies and confusion that prevailed in the
ncerning water pollution control; and the
standards set up by the Federal Water
n Control Act Amendments of 1972. The
ystem and the issues of the Amendments
ussed. The Amendments basically are a
of regulation that has the Federal Govern-
t the standards for water quality and the
vernments are then to supply the man-
to administer and enforce the permit
The author states that if the governmental
involved are primarily interested in the
of water pollution, then this new allocation
rs will provide the basis for a more effec-
rational water quality control program.
r, if the states feel that the system is an in-
nt of their rights, then the objectives of
ation will suffer substantially. (Orr-FIRL)

agencies and programs involved with
and researching ocean dumping are
. The Marine Protection, Research, and
es Act of 1972 was passed in an effort to
or strictly limit' the ocean dumping of harmful materials and to prevent 'unreasonable degradation' of the marine environment. Under the Act certain duties and responsibilities regarding ocean dumping were assigned to the Environmental Protection Agency (EPA), the Army Corps of Engineers, and the National Oceanographic and Atmospheric Administration. The Act places a strict ban on the ocean dumping of certain highly dangerous substances and gives the EPA the power to regulate dumping of other substances by the issuance of permits. The permit system suffers from a lack of funding and manpower and an inability to measure harm done by dumping. The author points out that recently the EPA suspended granting of special three-year, easily renewable permits and is now issuing primarily interim one-year permits which are subject to elaborate scrutiny prior to renewal. (Altuve-Florida)

**INTERNATIONAL LEGAL IMPLICATIONS OF OFF-SHORE TERMINAL FACILITIES,**
S. A. Dorshaw.
Texas International Law Journal, Vol 9, p 205-223 (1973). 19 p, 96 ref.

Descriptors: *International law, *International waters, *Oil industry, *Treaties, Law of the sea, Legal aspects, Jurisdiction, Political aspects, Continental shelf, Oceans, Federal jurisdiction, State jurisdiction, Governments, Governmental interrelations, Judicial decisions, Foreign countries.
Identifiers: *Off-shore terminal facilities, Submarine coastal lands, International Court of Justice.

Because of increasing advances in technology, a great concern has arisen over the issues of jurisdiction, sovereignty and control over submarine coastal lands. The author is particularly concerned with international conventions and general principles of international law that pertain to the rights and obligations of nations in the construction and operation of off-shore terminal facilities on the continental shelf and on the high seas. Because this type of facility is relatively new, the legal incidents have not been fully developed. While the 1958 Geneva Conference on the Law of the Sea did not address the problem specifically and in fact concerned itself primarily with issues related to the exploration and exploitation of natural resources, the exercise of jurisdiction by coastal nations over the outer continental shelf and the superadjacent high seas for construction and operation of offshore terminal facilities would probably constitute a reasonable use under the Geneva Convention. The only judicial forum available to test such jurisdicational power is the International Court of Justice at the Hague which has limited powers of enforcement. (Altuve-Florida)

**OBSTACLES TO TAMING CORPORATE POLLUTERS: WATER POLLUTION POLITICS IN GARY, INDIANA,**
Hampshire Coll. Amherst, Mass. Dept. of Political Science.
E. Greer.
Environmental Affairs, Vol 3, p 199-220, (1974). 22 p, 117 ref.

Descriptors: *Lake Erie, *Indiana, *Water pollution, *Legislation, Legal aspects, Governmental interrelations, Pollution abatement, Water pollution control, Industrial wastes, Water pollution sources, Law enforcement, Water quality, Industrial plants, Cost-benefit analysis, Economic impact, Social impact, Alternative costs, Area redevelopment, Benefits, Employment, Administration, Federal jurisdiction, State jurisdiction, Rivers and Harbors Act.
Identifiers: *Water Pollution Control Act, Bureaucracy, Indiana Stream Pollution Control Board.

Although U.S. Steel founded Gary, Indiana, it has failed to use its vast resources to limit harmful pollution and in fact is responsible for the grave pollution problems currently present in Gary and affecting Lake Michigan. The City of Gary has been placed in the precarious position of trying to protect its environmental existence while fearing that pressure on U.S. Steel to clean up its water pollution might cause it to leave Gary and seriously injure the economy. The State of Indiana has a Stream Pollution Control Board, but the Board has lacked the funding and impetus to effectively enforce the State's water pollution regulations. U.S. Steel has been held in violation of several regulations but has been given repeated extensions to remedy the situation. The 1899 Rivers and Harbors Act and the Water Pollution Control Act control the regular discharge of industrial effluents. Because of administrative problems, bureaucratic intricacies, and the complex interaction of the laws, the federal government has failed to substantially affect U.S. Steel's continuing pollution. Identifiers: *Environmental Protection Agency, National Pollutant Discharge Elimination System, Public hearings, Standing, Administrative remedies.

The heart of the water quality program under the Federal Water Pollution Control Act is the permit system administered by the National Pollutant Discharge Elimination System (NPDES). The author is concerned with administrative and judicial review of proposed permits or issued NPDES permits. Under administrative review a person may seek a public hearing or an adjudicatory hearing. A public hearing is informally structured and is designed for the collection of facts relating to a permit issuance. Public hearings are held when the 'Regional administrator finds a significant degree of public interest in a proposed permit.' An adjudicatory hearing may follow a public hearing where a permit has been issued or may occur with regard to a proposed permit issuance. Adjudicatory hearings are similar to court proceedings; highly structured and dealing with sharply drawn issues. There is some question of standing to be a party for permit review but the author feels the agency will take a liberal view of standing requirements. The decision of the adjudicatory hearing may be reviewed by the Administrator of the Environmental Protection Agency. After a party has exhausted all of his administrative remedies he may seek judicial review in the Circuit Court of Appeals. (Altuve-Florida)

Identifiers: *National Environmental Policy Act, *Environmental impact statement, Disclosure.

As a result of the passage of the National Environmental Policy Act of 1969 (NEPA), the federal courts have become available to environmental plaintiffs as forums for particular grievances and as means of opening the administrative process to citizens. In the early NEPA decisions, the courts focused upon the adequency of Environmental Impact Statements (EIS) issued by the agencies emphasizing the NEPA requirements for full disclosure of environmental impact and feasible alternatives. More recently the courts have begun to realize that disclosure along does not guarantee serious consideration of the pros and cons by the agency involved. Thus some courts have read section 101 of NEPA to require review on the merits throughout the process of the project planning, subjecting agency decisions to reversal in the event of a 'clear error of judgement'. In response, a legislative and judicial backlash appears to be building. Courts recently have noted that 'emotional environmentalism must be tempered with rational realism'. (Altuve-Florida)

**ALABAMA'S WATER RESOURCES POLICY.**
Alabama Development Office, Montgomery.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-234 755, $3.25 in paper copy, $2.25 in microfiche. March 1973. 13 p, 1 map, 16 photo.

Descriptors: *Water policy, *Water resources, Land resources, *Alabama, Land, Population, Water conservation, Water demand, Water quality, Water quality control, Water resources development, Water sources, Water supply, Water utilization.
Identifiers: State policy.

Water resources policy and planning objectives are intimately related to each other and to the public interest. The policy of the State of Alabama is to bring about the systematic development of Alabama's human and natural resources, so that the total water resources of the state will be conserved, developed and used for the maximum benefit of all people of the state. A growing population, an expanding economy, and increasing urbanization make it continually more difficult to properly develop and manage the State's water resources. In future years, the problems of water resources management will become increasingly difficult as new and enlarged uses tax the state's resources. However, it is hoped that adequate and farsighted water resources policies supported by proper planning, implementation and management will enable the state to meet the challenge of providing a total environment of superior quality for all citizens of Alabama. Accomplishment of this objective will require, however, the cooperation of all levels of government, industry, business and the public. (Gagliardi-Florida)

Pursuant to the requirements of the Marine Protection, Research and Sanctuaries Act, enacted on October 23, 1972, this first annual report was submitted to Congress by the Department of Commerce. The Act provides for the regulation of ocean dumping, research on ocean dumping and other man-induced changes to ocean ecosystems, and the designation, acquisition, and administration of marine sanctuaries. Section 201 of the Act requires the Secretary of Commerce to maintain a program of monitoring and research regarding the effects of ocean dumping and to report the findings periodically to Congress. The Secretary must include an evaluation of the short-term ecological effects and the social and economic factors involved in ocean dumping, as well as long range effects of pollution on fishing, and man-induced changes of ocean ecosystems. This report presents a perception of the problem of ocean dumping as well as an overview of the more complex, longer-term problems of man's effects on the world's oceans. Included are relevant activities from the enactment of this act through the end of calendar year 1973. (Fernandez-Florida)

**MARINE SANITATION DEVICES--PROPOSED CERTIFICATION PROCEDURES AND DESIGN AND CONSTRUCTION REQUIREMENTS.**
Coast Guard, Washington, D.C.
Federal Register, Vol 39, No 42, Part II, p 8038-8044, March 1, 1974. 7 p.

Descriptors: *Water quality standards, *Administrative agencies, *Coast guard regulations, *Environmental sanitation, *Water pollution control, *Regulation, Control, Water quality, Water quality control, Water pollution sources, Federal government, Legal aspects, Sanitary engineering, Disposal, Sewage, Waste water(Pollution), Waste disposal, Environmental engineering, Sewage treatment, Waste water treatment, Water pollution, Waste treatment, Oceans.
Identifiers: Administrative regulations, Certification, *Federal Water Pollution Control Act Amendments of 1972, Coastal waters, Effluent limitations, Environmental policy, Hazardous substances(Pollution), National Pollutant Discharge Elimination System, Territorial waters.

This notice proposes Coast Guard regulations governing the design, construction, testing, certification, and manufacture of marine sanitation devices. In order to eliminate the discharging of untreated sewage from vessels into the waters of the United States, including territorial seas, subpart A prescribes regulations governing the design and construction of marine sanitation devices and procedures for certifying that marine sanitation devices meet the regulations and the standards of the Environmental Protection Agency (EPA), promulgated under the Federal Water Pollution Control Act. Further included are regulations governing the manufacture and operation of vessels equipped with marine sanitation devices. Subpart B prescribes procedures for certification of marine sanitation devices and recognition of facilities for the purpose of conducting tests and evaluations of marine sanitation devices. The final subpart provides specifications governing the design and construction of specified marine sanitation devices, and requires all devices, for which certification is requested, to meet the enumerated standards. Legal authority for these rules is found in the Federal Water Pollution Control Act. (Fernandez-Florida)

Identifiers: Administrative regulations, Effluent limitations, Pretreatment standards(Effluent), Environmental policy, Federal Water Pollution Control Act Amendments of 1972, Hazardous substances(Pollution), National Pollutant Discharge Elimination System.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the Canned and Preserved Fruits and Vegetables Processing category of point sources, by amending 40 CFR Chapter 1, Subchapter N to add a new part 407. This final rulemaking is promulgated by the Environmental Protection Agency (EPA) pursuant to the Federal Water Pollution Control Act. Guidelines are established for the following subcategories: apple juice, apple products, citrus products, frozen potato products and dehydrated potato products. In addition, EPA is simultaneously proposing a separate provision stating the application of the limitations and standards to users of publicly owned treatment works which are subject to pretreatment standards. Notice is given of proposed regulations concerning the application of effluent limitations guidelines for existing sources to pretreatment standards for incompatible pollutants. (Fernandez-Florida)

Descriptors: *Water quality standards, *Administrative agencies, *Regulation, *Effluents, *Sugarcane, *Food processing industry, Pollutants, Industries, Navigable waters, Wastes, Industrial plants, Discharge(Water), Industrial waters, Water pollution sources, Environmental effects, Pollution abatement, Federal government, Standards, Water pollution, Waste water treatment, Waste treatment, Treatment, Treatment facilities.
Identifiers: Administrative regulations, Effluent limitations, Pretreatment standards(Effluent), Environmental policy, FWPCA Amendments of 1972, Hazardous substances(Pollution), National Pollutant Discharge Elimination System.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the sugar processing category of point sources, by amending 40 CFR Chapter 1, Subchapter N, Part 409. Guidelines are established for the crystalline cane sugar and liquid cane sugar categories. The limitations govern the quantity and quality of pollutants or pollutant properties which may be discharged by a point source subject to the provisions of this regulations after application of the best available technology economically achievable. Additionally, the Environmental Protection Agency simultaneously proposes rules stating the application of the limitations and standards to users of publicly owned treatment works which are subject to pretreatment standards. Notice is given of proposed regulations concerning the application of effluent limitations guidelines for existing sources to pretreatment standards for incompatible pollutants. (Fernandez-Florida)
W75-10326

**INORGANIC CHEMICALS MANUFACTURING POINT SOURCE CATEGORY.**
Environmental Protection Agency, Washington, D.C.

Federal Register, Vol 39, No 49, Part II, p 9612-9639, March 12, 1974. 28 p.

Descriptors: *Water quality standards, *Administrative agencies, *Regulation, *Chemical wastes, *Inorganic compounds, *Effluents, Chemical industry, Industries, Discharge(Water), Industrial wastes, Water pollution sources, Environmental effects, Pollution abatement, Federal government, Standards, Water pollution, Chemicals, Recycling, Waste water treatment, Waste treatment, Water reuse, Treatment, Treatment facilities, Flocculation.
Identifiers: *Administrative regulations, *Effluent limitations, *Pretreatment standards, Environmental policy, FWPCA Amendments of 1972, Hazardous substances(Pollution).

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the inorganic chemicals manufacturing category of point sources, by amending 40 CFR Chapter 1, Subchapter N, to add a new part 415. Twenty-two subcategories have been established based on the chemical product manufactured. Where total recycle, sale, recovery, or reuse of process waste water is technically and economically feasible, the discharge of all process waste water pollutants is limited. Discharge of pollutants to municipal treatment systems is allowed in limited quantities necessary to ensure adequate treatment and to prevent interference with the performance of the system. The effluent limitations in this regulation generally will be applied as absolute discharge limitations. Treatment alternatives include sedimentation basins, flocculators, and clarifiers. For chemical subcategories which disallow discharge of process waste water pollutants to navigable waters and for which ponds may be part of the treatment system, an allowance is provided to permit a discharge of process waste water from a plant located in an area where rainfall exceeds the evaporation rate or in the event of a catastrophic rainfall. (Fernandez-Florida)
W75-10327

**ELECTROPLATING POINT SOURCE CATEGORY; COPPER, NICKEL, CHROMIUM AND ZINC ON FERROUS AND NONFERROUS MATERIALS SUBCATEGORY.**
Environmental Protection Agency, Washington, D.C.
Federal Register. Vol 39, No 61, Part II, p 11510-11516, March 28, 1974. 7 p.

Descriptors: *Water quality standards, *Administrative agencies, *Regulation, *Effluents, *Inorganic compounds, *Iron alloys, Copper, Metals, Chromium, Zinc, Hydrogen ion concentration, Discharge(Water), Industrial wastes, Water pollution sources, Environmental effects, Pollution abatement, Federal government, Standards, Water pollution, Waste water treatment, Waste treatment, Treatment, Treatment facilities.
Identifiers: Administrative regulations, Effluent limitations, Pretreatment standards(Effluent), Environmental policy, FWPCA Amendments of 1972, Hazardous substances(Pollution), National Pollutant Discharge Elimination System.

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the electroplating category of point sources by amending 40 CFR Chapter 1, Subchapter N, to add a new Part 413. Subcategories governed by the regulation include: electroplating of copper, nickel, chromium, and zinc on ferrous and nonferrous materials. The provisions of this regulation are applicable to discharges of pollutants resulting from the process in which a ferrous or nonferrous base material is rack or barrel electroplated with copper, nickel, chromium, zinc, or any combination thereof. The best practicable control technology currently available consists of cyanide destruction, equalization, and pH adjustment. In addition, the Environmental Protection Agency is simultaneously proposing a separate provision stating the application of the limitations and standards to users of publicly owned treatment works which are subject to pretreatment standards, as well as application to pretreatment standards for incompatible pollutants. (Fernandez-Florida)
W75-10328

**THERMAL DISCHARGES--PROPOSED PROCEDURES FOR THE IMPOSITION OF ALTERNATIVE EFFLUENT LIMITATIONS.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 61, p 11434-11441, March 28, 1974. 8 p.

Descriptors: *Water quality standards, *Administrative agencies, *Permits, *Regulation, *Discharge(Water), *Thermal pollution, Legal aspects, Fish, Aquatic life, Wildlife, Biota, Bodies of water, Thermal water, Environmental effects, Effluents, Pollution abatement, Temperature, Water cooling, Water temperature, Federal government, Standards, Water pollution, Heated water, Federal Water Pollution Control Act.
Identifiers: Administrative regulations, Effluent limitations, *National Pollutant Discharge Elimination System, *Pretreatment standards(Effluent), Environmental policy, FWPCA Amendments of 1972, Hazardous substances(Pollution).

The proposed regulations establish procedures for the imposition of alternative effluent limitations on the thermal component of discharges, authorized by section 316(a) of the Federal Water Pollution Control Act, as amended. Alternative effluent limitations may be imposed by the Environmental Protection Agency Administrator, if the owner or operator of a point source has demonstrated to the satisfaction of the administrator that proposed effluent limitations are more stringent than necessary to assure the protection and propagation of a balanced indigenous population of shellfish and fish and wildlife. Granting of National Pollutant Discharge Elimination System permits is made contingent upon a showing by the applicant of absence of prior harm, in the case of a point source which has commenced operation and discharge, and a demonstration that representative, important species will be adequately protected. Evidence may be produced in the forms of historical biological data, physical monitoring data, engineering or diffusion models, or any other relevant information. (Fernandez-Florida)

**ASBESTOS MANUFACTURING POINT SOURCE CATEGORY--EFFLUENT LIMITATIONS GUIDELINES.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 39, Part II, p 7526-7535, February 26, 1974. 10 p.

Descriptors: *Water quality standards, *Administrative agencies, *Regulation, Standards, *Effluents, *Asbestos, Silicates, Asbestos cement, Calcium compounds, Inorganic compounds, Federal government, Legal aspects, Control, Wastes, Industrial wastes, Environmental effects, Environmental control, Pollutants, Pollution abatement, Treatment, Waste treatment, Industrial plants, Specifications.
Identifiers: Administrative regulations, Effluent limitations, Pretreatment standards(Effluent), Environmental policy, Hazardous substances(Pollution).

The purpose of this notice is to establish final effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources in the asbestos manufacturing category of point sources by amendi 40 CFR Chapter 1, Subchapter N, to add a ne Part 427. Subcategories regulated include asbestos-cement pipe, asbestos-cement shee asbestos paper (starch binder), asbestos pap (elastomeric binder), asbestos millboard, asbest roofing products, and asbestos floor tile. Ea subpart delineates its applicability, specializ definitions, standards of performance a pretreatment standards for new sources, and e fluent limitations guidelines representing t degree of effluent reduction attainable by the a plication of the best practicable control technolo economically achievable and currently availabl Additionally, the Environmental Protection Age cy proposes a provision stating the application the limitations and standards to users of public owned treatment works which are subject pretreatment standards. (Fernandez-Florida)

**FERROALLOY MANUFACTURING POIN SOURCE CATEGORY.**
Environmental Protection Agency, Washingto D.C.
Federal Register, Vol 39, No 37, Part 11, p 680 6814, February 22, 1974. 9 p.

Descriptors: *Water quality standard *Regulation, *Administrative agencies, Standard *Effluents, *Iron alloys, Legal aspects, Contro Federal government, Wastes, Industrial waste Environmental effects, Environmental contro Alloys, Pollutants, Pollution abatement, Trea ment, Waste treatment, Industrial plants, Specif cations, Air pollution.
Identifiers: Administrative regulations, Efflue limitations, Pretreatment standards(Effluent), E vironmental policy, Hazardous su stances(Pollution).

The purpose of this notice is to establish final e fluent limitations guidelines by the Environment Protection Agency (EPA) for existing sources ar standards of performance and pretreatment sta dards for new sources in the ferroalloy manufa turing category of point sources, by amending CFR Chapter 1, Subchapter N, to add a new Pa 424. In addition, the EPA simultaneously propos a separate provision stating the application of t limitations and standards to users of public owned treatment works which are subject pretreatment standards. Subpart A of the regul tion covers open electric furnaces with wet air po lution control devices, and delineates efflue limitation guidelines representing the degree of e fluent reduction attainable by the application the best practicable control technology current available as well as economically achievable. Th part also sets standards of performance ar pretreatment standards for new sources. Subpa B regulates covered electric furnaces and oth smelting operations with wet air pollution contr devices, and subpart C sets guidelines for sl processing. (Fernandez-Florida)

Identifiers: Administrative regulations, Effluent limitations, *National Pollutant Discharge Elimination System, Pretreatment standards(Effluent), Environmental policy, FWPCA Amendments of 1972, Hazardous substances(Pollution).

These regulations describe procedures for the imposition of alternative effluent limitations, with respect to the thermal component of discharges, authorized by section 316(a) of the Federal Water Pollution Control Act, as amended. The Administrator of the Environmental Protection Agency is responsible for determining that effluent limitations on the thermal component of proposed discharges are ' more stringent than necessary to assure the protection and propagation of a balanced, indigenous population of shellfish, fish and wildlife in and on the body of water into which the discharge is to be made'. The regulations require public notice of each proposed issuance, denial, or modification of a permit. An applicant may satisfy the burden of proof that aquatic biota will be adequately protected by showing an absence of prior appreciable harm, and provision for protection of representative important species through production of biological, engineering, and other data. Substantial, irreversible environmental modifications must be taken into consideration in identifying the balanced indigenous communities. (Fernandez-Florida)

**BUILDERS PAPER AND BOARD MANUFACTURING POINT SOURCE CATEGORY--EFFLUENT LIMITATIONS GUIDELINES.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 9, Part 11, p 1818-1821, January 14, 1974. 4 p.

Descriptors: *Water quality standards, *Administrative agencies, *Regulation, *Water pollution control, *Water pollution treatment, *Effluents, Water quality, Water quality control, Water treatment, Federal government, Legislation, Legal aspects, Water Quality Act, Water pollution, Federal Water Pollution Control Act, Water pollution sources, Treatment, Treatment facilities, Pulp and paper industry, Pulp wastes, Wood wastes.
Identifiers: Administrative regulations, Effluent limitations, Pretreatment standards(Effluent), Environmental policy, Federal Water Pollution Control Act Amendments of 1972, Hazardous substances(Pollution), National Pollutant Discharge Elimination System.

Notice is given of proposed effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources for the builders paper and roofing felt subcategory of the builders paper and board manufacturing category of point sources. Legal authority for promulgation of these rules by the Environmental Protection Agency (EPA) is found in the Federal Water Pollution Control Act. The instant subcategory includes mills which produce the heavy papers used in the construction industry from cellulose fibers derived from waste paper, wood flour and sawdust, wood chips, and rags, without bleaching or chemical pulping. Builders papers are generally characterized as saturating papers, flooring paper, and deadening papers which are used in the construction and automotive industries. Significant pollutant parameters in waste waters include five day biochemical oxygen demand, total suspended non-filterable solids, and pH. Effluent limitations guidelines and standards of performance are established to control these pollutants. Treatment and control technology includes water re-use and recirculation, preliminary screening, primary sedimentation, biological treatment, and physical chemical treatment. (Fernandez-Florida)
W75-10336

**STEAM ELECTRIC POWER GENERATING POINT SOURCE CATEGORY--EFFLUENT GUIDELINES AND STANDARDS.**
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 39, No 196, Part 111, p 36186-36207, October 8, 1974. 22 p.

Descriptors: *Water quality standards, *Administrative agencies, *Regulation, *Effluents, *Steam, *Electric power, Thermal power, Thermal powerplants, Waste treatment, Treatment, Treatment facilities, Pollutants, Industries, Navigable waters, Wastes, Industrial plants, Discharge(Water), Industrial wastes, Water pollution sources, Environmental effects, Pollution abatement, Federal government, Standards, Water pollution, Waste water treatment.
Identifiers: Administrative regulations, Effluent limitations, Pretreatment standards(Effluent), Environmental policy, FWPCA Amendments of 1972, Hazardous substances(Pollution), National Pollutant Discharge Elimination System.

The purpose of this notice is to establish final effluent limitations and guidelines for existing sources and standards of performance and pretreatment standards for new sources in the steam electric power generating category by amending 40 CFR Chapter 1, Subchapter N to add a new part 423. Subcategories regulated include: generating unit, small unit, old unit, and area runoff. With respect to the first three subcategories, this regulation applies to discharges resulting from the operation of a generating unit by an establishment primarily engaged in the generation of electricity for distribution and sale which principally results from a process utilizing fossil-type fuel or nuclear fuel in conjunction with a thermal cycle employing the steam-water system as the thermodynamic medium. Limitations are established regarding the quantity and quality of pollutants or pollutant properties which may be discharged by a point source subject to the provisions of this regulation. The pH of all discharges, as well as polychlorinated biphenol compounds, and low volume waste sources are limited through the application of a flow rate formula. (Fernandez-Florida)

Identifiers: *Multiobjectives, *Budget constraints, *Investment criteria, *Lehigh River(Penn), Income distribution, Regional income.

A multiobjective mathematical programming model was developed for the Lehigh River, Pennsylvania, in locally and globally optimal versions. Objectives for the Lehigh representing each of the four accounts of the Water Resources Council's proposed 1970 standards are discussed and the models are formulated for three of these: increasing national income, regional and class income distribution, and environmental quality. The design variables in the model are the reservoirs and power plants considered in the Corps of Engineers' 1961 report on the Delaware river basin, which includes the Lehigh. Runs of the models were made for one, two and three objectives, constrained by total and local budgets of varying size. Results from the globally optimal model are presented. These show the estimated effects on multidimensional net benefit surfaces and on the design variables of the budget constraints. There is a general discussion of the nature and use of budget constraints in multiobjective planning, and suggestions are made for implementing the work at the district (Corps) or region (Bureau of Reclamation) levels.

Identifiers: *Sensitivity analysis, *Grande Ronde Basin(Ore), Operating procedures, Water uses, Water flows, Changes, Exogenous variables, Endogenous variables.

Application of a computer simulation model to the Grande Ronde River basin in northeastern Oregon is described. The model considers the effects of changes in sets of capital and in operating procedures on project benefits and costs. The methodology employed is probabilistic, utilizing hydrologic data for simulation of water flows and probability distributions for amounts of capital investment and annual operation and maintenance costs. Exogenous variables include: hydrologic data based on 41 years of historical data; capital sets for three different sizes of two reservoirs; and operating procedures for three scales of irrigation development. The functional relationships for benefits entail relationships between hydrologic phenomena and benefits for seven uses of water: irrigation; municipal and industrial water supply; recreation; salmon reared in reservoir; resident trout in reservoir; flood control; and anadromous fish. The endogenous variables resulting from running the model include net present benefits and benefit-cost ratios for nine reservoir combinations and three operating procedures (a decision set of 27). Results indicate that some decision sets are clearly superior to others and reduce the choice set from 27 to three. The simulation model provides a framework for the analysis of dam sizes for river basin planning. (See also W75-02615) (Bell-Cornell)

Identifiers: *Cam River(Cambridge Engl), Automatic control systems, Cost function, Mass balance.

A preliminary study is made of the dynamic o
timization problem for a river with many pollute
using a recently developed model of a section
the river Cam near Cambridge, England. Due
the high dimensionality of the system, it is comp
tationally prohibitive to obtain optimal solutio
But the system has a fairly simple structure whi
could be utilized to alleviate the computatio
burden. A simple hierarchical structure
proposed for the river pollution control and t
strategy is demonstrated on a digital simulatio
For the practical implementation of the strategy
is necessary, however, to have available the st
vector of the system. In practice, only certain c
rupted measurements of the outputs are availab
It is therefore necessary to construct a state e
mator. Like the optimal controller, the optim
estimator also requires prohibitive amounts
computation. However, a hierarchical strate
similar to the control strategy could be used to
leviate the computational burden. Such an estim
tor is also demonstrated on a digital simulation
the river. The simple approach to control and st
estimation described here appears to be promisi
since it is able to provide virtually optimal p
formance and has modest enough computatio
requirements to enable it to be implemented o
single small computer. (Bell-Cornell)

e original assumption that individuals are capa-
of accurately reporting the magnitude of social
anges was unjustified as was noted in the data.
specific analysis of a number of variables relat-
to the variations in perceptual error revealed
t no one single factor could be used as a reliable
edictor of these errors. Other social and
ychological variables might be selected to better
present the selective processes of exposure, per-
ption and retention. For example, rather than
taining estimates from respondents regarding
milies displaced or jobs eliminated by reservoir
nstruction for the entire reservoir area, it may
necessary to use respondent-defined neighbor-
od areas within which the estimates are ob-
ned. For applied research, it is clear from the
gnitude of error that the average citizens and
o the community leaders fail to comprehend the
gnitude of changes in which they have been
ught up. This lack of awareness and understand-
appears to be one factor related to the depres-
n of apparanent organizational response to
anges in the physical and social environments.

s project sets up an economic model that is
dily applicable to evaluating the economic ef-
ts of small recreation-oriented reservoirs upon
local economies of the area in which the reser-
r is located. The economic effect was measured
erms of personal income. The approach used
s to determine the amount of basic income
ated by the reservoir, and then multiply that by
area's basic income multiplier. The model was
lied to Flint Creek Reservoir in Stone County,
sissippi. During a 12 month study period, the
ervoir attracted 104,336 visitors; most of them
e nonlocal. Expenditures by nonlocal visitors
e converted into basic income created in the
l area. Each camping visitor resulted in ap-
ximately $1.75 of additional basic income in the
a or a total $31,300 in new basic income. Day
tors added $1,300 to the total. Expenditures by
operator, the Pat Harrison Waterway District,
wages and salaries to local area residents represented an additional $82,400 in basic income. The basic income multiplier for Stone County is approximately 1.64. All basic income attributable to the reservoir was multiplied by this factor to obtain an estimate of the total effect of the reservoir on personal income in Stone County of $188,600. In addition, the reservoir generates approximately $15,900 annually of new sales taxes of which almost $13,500 is given to the county.

Descriptors: *Feasibility studies, *Recreation, *Water sports, Reservoirs, Management, Reservoir storage, Recreation facilities, *Recreation demand, Fishing, *Sport fishing.
Identifiers: *High country reservoirs, *Water-based recreation.

High country water storage reservoirs were studied for the purpose of developing a user profile which could be used to predict recreation users desires. Findings identify several sub-groups of the recreation user public at high-country reservoirs. Management information has been gathered, which will be helpful in making decisions on what facilities to provide, where to provide them, which reservoirs to open for various users, what use might be expected, what type of access is needed, what users will pay for the experience, and what type of fishery is needed. A surprising findings from the fisherman profile indicates that most fishermen do not care if they catch a single fish, but are more interested in other qualities of the experience. **METHODS TO FACILITATE MANAGERIAL EFFECTIVENESS IN MUNICIPAL WATER SYSTEMS,**
Mississippi State Univ., Mississippi State. Bureau of Business and Economic Research.
K. W. Hollman, R. F. Bush, J. F. Hair, Jr., E. E. Milam, and J. H. Sellers.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 565, $4.25 in paper copy, $2.25 in microfiche. Completion Report, Mississippi Water Resources Research Institute, Mississippi State, July 1975. 59 p, 14 tab. OWRT B-010-MISS(1).

Descriptors: *Cost analysis, *Management, Water supply, *Mississippi, *Municipal water, *Model studies, *Water management(Applied), Utilities, *Cost comparisons, Cost trends.
Identifiers: Multiple discriminant analysis, Multiple factor analysis.

The project focused on the quality of municipal water system management in Mississippi. The primary objectives were to determine what factors play a part in achieving greater efficiency in water system management and to what extent. An analytic model using multiple discriminant analysis and multiple factor analysis was formulated. A subset of 45 municipal water systems in Mississippi was used for the data base. Initially, twenty-two variables classified by degree of controllability and by major cost category were selected, but the model was later reduced to 12 variables. The systems were divided into three groups of 15 each on the basis of efficiency. Then the multivariate techniques were used to identify the significant cost variables within each general cost category at each efficiency level, and a relative numeric measure of the importance of each cost factor in each of the three levels of performance was computed. The study shows that a model with only a small number of variables, but with a high predictive accuracy, can be developed to assign water utilities to appropriate efficiency level groups. Information generated by the model will help municipal water managers to determine the amount of change in each of a few significant cost variables that is necessary for their system to reach a prespecified cost improvement goal.

**WATER RESOURCES DEVELOPMENT AND WILDERNESS VALUES: A STUDY OF THE UPPER HUDSON RIVER,**
Cornell Univ., Ithaca, N.Y., Water Resources and Marine Sciences Center.
G. R. Reetz.
Available from the National Technical Information Service as PB-243 736, $5.75 in paper copy, $2.25 in microfiche. Completion Report, 140 p, 26 tab, 11 fig, 151 ref, 2 append. OWRT A-043-NY(1). 14-31-0001-3832, 4032.

Descriptors: *Water resources development, *Decision making, Reservoir sites, *Hudson River, *Planning, Preservation, Environmental effects, *New York, Values, *Evaluation, Aesthetics, Water values, Social values.
Identifiers: Gooley Reservoir(NY), *Wilderness values, Preservation organizations.

Conflicts between water resources development proposals and desires to preserve natural environments have occurred in many areas of the United States, the debates often reaching the highest levels of government. Growing demands for both water and wilderness suggest a potential for increased competition in the future. The controversy over the proposed Gooley Dam, on the Upper Hudson River, provided a case study to examine the planning-evaluation-decision making processes as they relate to preservation-development conflicts. The Hudson River Gorge, focal point of the Gooley conflict, was visited by a total of 3900 people during the summers of 1972 and 1973. Questionnaires, with response rates from 85 to 87 percent, indicate an overwhelming desire to maintain the Gorge in its natural state. Major water resources planning programs were precipitated by the drought of the mid-1960's. Both Federal and State efforts identified the Gooley Reservoir as the most desirable alternative for meeting the water supply needs of the greater New York metropolitan area. Environmental parameters were examined but not given sufficient emphasis in initial planning efforts. Preservation interests, working through political processes, appear to have been more instrumental in preserving the Upper Hudson than were the planning agencies' attempts at environmental analysis.

**ECONOMIC ASPECTS OF PRECIPITATION AUGMENTATION OVER THE GREAT LAKES,**
Illinois State Water Survey, Urbana.
G. E. Stout.
In: Proceedings of the World Meteorological Organization/International Association of Meteorology and Atmospheric Physics Scientific Conference on Weather Modification, October 1-7, 1973, Tashkent (USSR). WMO No. 399, Geneva (Switzerland), p 431-438, 1974. 4 fig, 2 tab, 4 ref.

Descriptors: *Weather modification, *Artificial precipitation, *Benefits, *Great Lakes, Cost-benefit analysis, Economics, Annual benefits, Lakes, Lake Michigan, Cloud seeding, Precipitation(Atmospheric), Rainfall, Snowfall.
Identifiers: *Lake level regulation.

It has been proposed by Dr. Helmut Weickmann that one could recycle, by cloud seeding, some of the evaporative water from the Great Lakes directly into one of the lakes. High evaporational rates occur when polar or arctic air masses cross an open warm water surface during the fall and early winter. The recycled water would be most beneficial during periods of low water levels in the lake system. The cloud physics aspects of such a water augmentation program were not discussed. It was assumed that a 10, 20, or 30% increase is within potential capability. The waters of the Great Lakes are used for power generation, shipping, recreation, and water supply. One would not want to seed the clouds during the period of high water. It is generally known that anytime the lake level exceeds the average lake level the benefits from extra water would be negligible. Losses to property are high when the lake levels approach their maximum levels. At the present time, Chicago has an adequate water supply from the lake, but as the demands increase and the population grows in the suburbs the city may eventually need to withdraw more water. The value of the water Chicago presently withdraws, plus the value of the benefits to navigation, power, and shore property from a 20% increase from cloud seeding during the critical years was estimated to be $4.5 to $6.8 million per year. Based on preliminary discussion with a commercial cloud seeder, the costs of a seeding program would be about $500,000 per fall. Therefore, the benefits on the conservative side appear to be about 9 to 1. (See also W75-09944) (Sims-ISWS)

**PROCEEDINGS OF WORKSHOP CONFERENCE ON IDENTIFICATION OF METROPOLITAN AREA WATER RESOURCES PROBLEMS AND ASSOCIATED RESEARCH NEEDS IN MINNESOTA.**
Minnesota Univ., St. Paul. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 793, $3.25 in paper copy, $2.25 in microfiche. Oct 1973, 22 p. OWRT A-028-MINN(4). 14-31-0001-4023.

Descriptors: *Water resources development, *Minnesota, *Research priorities, City planning, Comprehensive planning, Surveys, Land use, Coordination, Long-term planning.
Identifiers: *Water resources problems, *Minneapolis-St Paul Metropolitan area(Minn), Research needs.

The Water Resources Research Center, University of Minnesota, is developing a long-range comprehensive plan for water resources research in Minnesota involving Federal, State and local agencies, private organizations, Consultants, University of Minnesota, State and private Colleges, Interest Groups, and citizens. An attempt is being made to formulate broad research guidelines by inventorying research needs and assigning priorities. The object of this Workshop Conference was to identify research needs and priorities for the Minneapolis-St. Paul Metropolitan area in Minnesota. Conference participants identified the following high priority needed water resources research topics: Development of Water Resources Information System and Data Banks; Conservation of Water Resources; Groundwater System Analysis; Statewide Water Resources Planning; Solving Water Supply Problems in Twin Cities Metropolitan Area; Institutional Arrangements for Coordinating Water Resources Programs; On-Land Waste Disposal Practices; Financing Water Resources Programs; Shoreland, Floodplain and Water Surface Zoning; and Integrating Land-Use and Water Resources Planning. ntifiers: New Melones Dam(Calif), *Stanislaus er(Calif), Environmental costs.

timated costs and benefits from a Corps of En-eers benefit-cost analysis are re-evaluated with phasis on the degree to which sponsoring agen-s can arrange factors in a light favorable to their n projects. The New Melones Dam project on Stanislaus River, California has been analyzed costs and benefits several times since 1961, the 2 environmental impact statement analysis pro-ed the summarized benefit-cost calculations e examined. Corps of Engineers estimates of efits included the categories of flood control, gation, power generation, recreation, fish and dlife, water quality, and area development. h and low values are calculated in the reevalua-n for each benefit component. While the power eration benefits are accepted provisionally, the mated high value for the other benefits is less each component than in the Corps analysis. od benefits were overstated by a factor of two result of using the average benefit from a se-of projects. A $3.6 million discrepancy for ir-tion occurred because an anticipated crop e reduction was not taken into account. Other nponents were over estimated due to a range of rsights. The estimated project cost used in the inal benefit-cost ratio was low as a result of g an incorrectly calculated discount rate. cker-Wisconsin)

E BENEFIT-COST RATIO IN RESOURCE VELOPMENT PLANNING,
nomic Research Service, Washington, D.C.
. Pavelis.
thern Journal of Agricultural Economics, Vol o 4, p 161-166, 1971. 4 fig, 1 tab, 15 ref.

criptors: *Cost-benefit ratio, *Project ning, *Economic efficiency, *Evaluation, timization, Mathematical studies, Return to e, Resource mix.

mathematical ratio of total capitalized efits over total capitalized costs can mislead ners and legislators to invest capital and other ts in less than fully efficient patterns of urce development. The benefit-cost ratio is nined for both linear and nonlinear cost func-s, and in terms of capital restrictions and rates turn. The benefit-cost ratio as popularly com-d in resource evaluations is an appropriate rion for allocation decisions if the ratio does change with the amount of money represented he total cost, i.e., there is a straight-line rela-between total costs and total benefits. Where fit-cost relationships are not linear, projects be compared validly by the benefit-cost ratio rion alone only if the scale is fixed at the same level among alternatives. Proper use of the fit-cost ratio in appraising projects with a inear function reflects changes in the relation osts are changed. If only one project with a inear function is being considered, the omic rule is to incur costs to the point where d total cost is equal to added total benefit. The ral rule for a multi-project series is to incur such that marginal net benefits are the same projects undertaken. (Becker-Wisconsin)

**PRIMARY ECONOMIC IMPACT OF THE GULF INTRACOASTAL WATERWAY IN TEXAS,**
Texas Engineering Experiment Station, College Station.
J. Miloy, and C. Phillips.
Available from the National Technical Information Service, Springfield, Va 22161 as COM-74-11552, $7.25 in paper copy, $2.25 in microfiche. Sea Grant Program Report TAMU-SG-74-211, March 1974. 213 p, 39 fig, 38 tab, 45 ref.

Descriptors: *Input-output analysis, *Industrial production, *Texas, *Economic impact, *Inland waterways, Gulf coastal plain, Chemical industry, Oil industry, Barges, Land use, Transportation, Projections.
Identifiers: *Gulf Intracoastal Waterway, Commodity flow.

Industrial development in Texas reflects the continuing economic importance of water transportation as nearly three-fourths of the state's goods move by low-cost water transportation modes. Over 21 million acres adjoining the Texas shoreline constitute the state's coastal zone. An economic impact analysis, using input-output techniques, evaluating underlying processes linking various sectors of the economy, is presented for the coastal zone. Of the $1.77 billion which the Intracoastal Waterway directly contributes to the state's economy, the major components are from the water transportation industry and from the cargo value received from deep draft ports. A land use summary of the areas contiguous to the Texas portion of the Gulf Intracoastal Waterway indicates that this region is becoming increasingly attractive to firms that require high-volume low-cost transportation. Commodity flow statistics presented point to the chemical, crude petroleum and petroleum products industries as primary users. To facilitate the movement of these commodities, expanded and more efficient inland river systems and barges are needed. The future economic impact of the Intracoastal Waterway in Texas is determined based on anticipated demand for water transportation, which is influenced primarily by industrial growth in the coastal region and the cost of competing modes of transportation. (Becker-Wisconsin)

**THE EFFECTS OF AUTHORIZATION FOR WATER IMPOUNDMENTS ON SHORELAND TRANSITION,**
North Carolina Univ., Chapel Hill. Center for Urban and Regional Studies.
S. F. Weiss, R. J. Burby, and T. G. Donnelly.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 880, $3.25 in paper copy, $2.25 in microfiche. Preliminary Completion Report, 1971. 11 p, 6 tab. OWRT B-025-NC(1).

Descriptors: *Planning, *Land development, *Reservoirs, *Impoundments, Urbanization, *Land use, *North Carolina, Shores, *Social change, *Social values, *Property values, Pre-impoundment, Reservoir sites.
Identifiers: New Hope Reservoir(NC), Falls Reservoir(NC).

Objectives were to: (1) Identify and evaluate factors which explain the location of land transactions, changes in land prices or value, and changes in land use patterns which occur after the authorization of water impoundments. (2) Develop and test a model to predict short-term changes in land ownership, land value, and land utilization. (3) Develop a system for monitoring changes in land values, land use, and predictive factors utilized in the transition model as they occur in reservoir areas. (4) Prepare policy guides to enable the Corps of Engineers and state and local governmental agencies to prevent the exploitation of land in authorized reservoir areas and to facilitate desirable development to meet public land use objectives. Research completed included: (1) delineation and mapping of the authorized reservoir study areas; (2) identification of all individuals, firms, and institutions owning property and all sales and transactions occurring in the reservoir study areas during a period extending five years prior to reservoir authorization through 1969; (3) identification of land use changes in the reservoir study areas between 1963 (before authorization) and 1970; (4) analysis of the impact of reservoir authorization in terms of yearly land sales and average sales prices before and after authorization; and (5) analysis of the characteristics and attitudes of pre-authorization landowners. U.S. Bureau of Sport Fisheries and Wildlife, Resource Publication 116, 1974. For sale by the Superintendent of Documents, U.S. Government Printing Office, Wash., D.C. Price $1.15. 56 p, 5 fig, 1 tab, 27 plates, 57 ref. OWRT

Descriptors: *Wetlands, *Wildlife, Classification, *Northeast United States, New England, *Land classification, New York, Pennsylvania, New Jersey, Aerial photography, Land use, Vegetation.

A wetland classification system based on life forms and sub-forms of vegetation is offered for glaciated New England, New York, Pennsylvania and New Jersey. It is compatible with currently used national and regional systems, but emphasizes maximum wetland production and diversity rather than waterfowl alone. An example of the application of the system employing aerial photography is provided as are 27 photographic plates of the several classes and sub-classes.

**ACTIVITIES, CHARACTERISTICS, AND OPINIONS OF LAKEFRONT RESIDENTS: KISSIMMEE RIVER BASIN, FLORIDA,**
Florida Univ., Gainesville. Inst. of Food and Agricultural Sciences.
J. R. Conner, J. E. Reynolds, and K. C. Gibbs.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-243 882, $4.25 in paper copy, $2.25 in microfiche. Bulletin 755, January 1973. 68 p, 1 fig, 28 tab. OWRT B-005-FLA(3) and OWRT B-007-FLA(9). 14-31-0001-3267.

Descriptors: *Water allocation(Policy), Water values, Water utilization, Water demand, Decision making, *Florida, *Attitudes, Water districts, *Property values, Aesthetics, Social values, *Water level fluctuations, *Recreation demand.
Identifiers: Kissimmee River basin(Fla), Lakefront residents.

Water in the Kissimmee River Basin can be controlled by the Central and Southern Florida Flood Control District. Both fluctuating and excessively low water levels have adverse impacts on the residents adjacent to the lakes and streams. In order to assess these impacts on the lakefront property and on aesthetic values held by the residents, studies are needed to identify the population of persons affected, to ascertain their opinions concerning various qualities of the lakes, and to determine the amount of lake use by these residents. The recreational users of the Kissimmee River Basin are of two types: (1) recreational visitors and (2) waterfront residents. This study was concerned with recreational data from a sample of waterfront residents in the Kissimmee River Basin. It was designed to obtain information regarding property values, recreational activities of the residents, ef-

fects of different water levels on the participation in different recreational activities, and opinions of the residents regarding the value of lakefront property as compared to other types of property. It was also concerned with the analysis and interpretation of the data obtained from this survey. (Morgan-Florida)

**A MATHEMATICAL PROGRAMMING APPROACH TO PUBLIC WATER PROJECT. PORTFOLIO SELECTION,**
Georgia Univ., Athens.
W. P. Neely.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 844, $6.25 in paper copy, $2.25 in microfiche. Ph.D. Dissertation, 1974, 161 p, 24 tab, 70 ref, 5 append. OWRT A-040-GA(3) 14-31-0001-3810.

Descriptors: Model studies, Projects, Multiple purpose, Cost-benefit ratio, Cost trends, Tennessee Valley Authority, *Mathematical studies, *Linear programming, *Capital, Budgeting, *Benefits, *Costs, *Long-term planning.
Identifiers: Multiple objectives, Portfolio selection, Net present value.

A model for selecting water resources projects for inclusion in portfolios of investment opportunities using mathematical programming techniques was developed and tested for several Tennessee Valley Authority projects. The portfolio approach was suggested as operationally superior to the independent project selection approach based on maximum benefit-cost ratio (BCR). The relationships of each project to each other project and to the expected budgets are accounted for with the portfolio approach. The (integer) programming method was suggested as a more effective method of portfolio selection than ranking by the maximum BCR. The optimum portfolio solution differs from the BCR solution due both to the complexity of the water resources problem and to the inadequacy of the BCR criterion. Long-term budget level determination was facilitated by the linear programming methods and individual project scheduling was improved by the programming method. The effects of uniform variation in costs and benefits were significant only in the case of variation in costs. Multiple objectives--economic and environmental improvement were incorporated into the model by use of the goal programming approach. Projects selected using the programming approach for portfolio selection were found to be different from those selected by BCR criteria and deemed superior on the basis of both net present value (NPV) and goal contribution.

L. Ortolano.
Journal of the Hydraulics Division, Proceedings of ASCE, Vol 100, No HY1, Paper No 10292, p 173-187, January 1974. 2 fig, 14 ref.

Descriptors: Water resources, *Water management(Applied), *Reservoirs, *Environmental effects, *Assessment, Evaluation, Planning, Decision making, *California, Environment, Social change.
Identifiers: *Impact prediction, *Carmel Valley(Calif).

Formal impact assessment, defined as the identification, description, and evaluation of changes associated with proposed actions, has been mandated by recent legislation relevant to Federal water resources agencies. An example involving proposed reservoirs in Carmel Valley, California to illustrate various concepts is introduced. Demonstrated is how 'evaluative factors'--defined as the goals, concerns, constraints, etc., that affected publics and other decision makers consider in ranking alternative actions--can be used in deciding on which impacts to forecast and at what levels of detail. Presented is a classification of 'causative factors' which encourages a systematic examination of the various aspects of a proposed action that may bring about change. Network diagrams of cause-effect relations, and the problems associated with the analysis of indirect impacts are also analyzed. The paper summarizes a number of characteristics of impact which can be used in describing the results of an impact assessment. Questions related to communication are especially important since a main reason for conducting an assessment is the development and communication of information to help people understand issues and make choices. The free competitive exploitation of a fishery as a common-property resource leads to an over-allocation of inputs to that fishery. A simple theoretical model developed to represent the commercial exploitation of the fishery is built around (1) the biological relationship between absolute increase in fish stock per time period and fish population size, and (2) the relationship between fishing yield and effort expended. The policy implications of the theory are that the fishery must be appropriated, preferably by the government, so that entry to the fishery can be restricted and exploitation maintained at the optimal level. The absence of such a policy leads to entry of new units into the fishery until excess profits are competed away, at which point the level of effort is greater than that is compatible with maintenance of the fish population. Each individual unit ignores the external effects of the demise of the fish population. An empirical study is presented that applies the theoretical model to the Manx Herring Fishery and investigated its economic efficiency and biological viability. Limitations of the model include: (1) its long-run static nature, and (2) the assumption of certain biological knowledge (which is not known) concerning the growth curves of the species under study. GEORGIA COUNTY COMMISSIONER ATTITUDES TOWARD WATER PROBLEMS,
Georgia Univ., Athens. Dept. of Political Science.
V. L. Marando.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-243 578, $4.25 in paper copy, $2.25 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No. ERC-0775, June 1975. 49 p, 7 tab, 8 ref, 1 append. OWRT A-045-GA(1). 14-31-000-4010.

Descriptors: *Attitudes, *Local governments, Water resources development, Political aspects, *Institutions, *Governmental interrelations, Institutional constraints, Georgia, Florida, *Water policy.
Identifiers: *County officials, Problem identification, Governmental responsibility.

The objective was to examine the attitudes of Georgia county commissioners toward water problems. The identification of water problems is necessary and precedes county decisions and policy on water issues. Commissioner attitudes toward water problems were examined within the context of all major issues which confront county commissioners. The basic assumption was that water issues constitute only a portion of the agenda of problems that confront commissioners. Three major conceptual components utilized for examining water issues were problem identification, problem severity and governmental responsibility. Eleven percent of the Georgia commissioners, as opposed to 17 percent of Florida commissioners, saw water and sewer problems as one of the two most pressing problems facing their county. When asked for details, even fewer Georgia commissioners identified any severe water problems. Furthermore, most commissioners viewed the responsibility for solving these problems as largely belonging to other governmental units. (James-Geo Tech).

LATITUDINAL ASPECTS OF THE LAW OF THE SEA AND OF PETROLEUM PRODUCTION,
Woods Hole Oceanographic Institution, Mass.
K. O. Emery.
Ocean Development and International Law Journal, Vol 2, No 2, p 137-149, 1974. 11 fig, 5 ref.

Descriptors: *International law, *Mineral industry, Land, Oceans, Population, Oil, Oil fields, Oil industry, International waters, International commissions, Industrial production, Taxes.
Identifiers: International agreements, State policy.

The land areas of the world lie mainly between 30 degrees S. Latitude and 70 degrees N. Latitude. Plans for ocean-floor sovereignty change this pattern very little. Probably by coincidence the latitudes of maximum population are the same as the latitudes of maximum oil production (20 degrees to 40 degrees N. Latitude). By contrast, the greatest concentrations of nations are farther south, and the greatest concentrations of gross national products are farther north. Addition of ocean floor to adjacent nations by rules now under consideration should not prompt undeveloped nations to concentrate upon claims to areas of ocean floor in the expectation that industrialized nations will extract the minerals and pay high taxes that might increase the standard of living in underdeveloped nations. Instead, these nations should recognize that most profits and jobs are found in the later stages of mining, manufacturing, distribution, and receiving of goods made from the minerals. Merely raising the prices of minerals or the taxes on them is not likely to solve the problem for underdeveloped nations because the price to these nations of manufactured goods is likely to be increased even more. THE FORGING OF THE UNION RECONSIDERED: A HISTORICAL REFUTATION OF STATE SOVEREIGNTY OVER SEABEDS,
Columbia Univ., N.Y. School of Law.
R. B. Morris.
Columbia Law Review, Vol 74, p 1056-1093, 1974. 215 ref, append.

Descriptors: *Continental shelf, *Atlantic Ocean, *Oil, *Oil industry, Energy, Subsoil, United States, Oceans, Navigation, State governments, State jurisdiction.
Identifiers: Energy crises.

The resolution of United States v. Maine will determine whether the states or the federal government has title to the continental shelf off the Atlantic coast. The litigation stems from the search for new sources of oil and gas as a response to the energy crisis. The defendant states, resisting the federal government's assertion of sovereignty over the seabed and subsoil off the Atlantic coast, predicate their claim on English law and specific colonial grants and charters. Critical to the states' claim is the contention that their existence as independent sovereignities proceded the formation of the national government. The United States, on the other hand, maintains that any rights to the seas, seabed and subsoil existed as an incident of external sovereignty, which it alone possessed as the sole sovereign entity to merge upon the issuance of the Declaration of Independence, if not before. The historical evidence indicates that the United States collectively asserted its jurisdiction over navigation even before the formation of the states. To argue that the states' assertion of a proprietary interest over the seabed and subsoil does not necessarily conflict with the federal domain over external affairs would be to ignore geographical realities, essential national defense concerns, critical energy needs and the whole course of American constitutional history.
